Note: This appendix is a compilation of working papers generated by the five Corps of Engineer Districts involved in the Floodplain Management Assessment. These working papers are often results of separate analyses that were synthesized to generate the main report. The data in these appendices were not as thoroughly reviewed to remove all inconsistencies or editorial errors as was accomplished for the main report. In some cases, numbers or percentages may have been reconciled in the main report but not in the appendix.

Public Involvement Work Group

1. Public Involvement Strategy

Identifying and Arraying Desires of All Interested Parties

The Public Involvement Work Group designed its program to meet the study objectives; particularly Objective B: Identify and array the desires of interested parties within the study area to reflect the diversity of opinions regarding appropriate future outputs from alternative uses of floodplain resources; and Objective F: Evaluate and prioritize alternative land and water resource actions based on consultation and coordination with affected Federal, State, and local entities through a series of public workshops or similar mechanisms.

Identifying and arraying the desires of interested parties within the study area was done to ensure that the assessment reflects the diversity of opinion regarding the alternative uses of floodplain resources. The public involvement strategy was based on two definitions: 1) All potentially affected individulas, agencies, organization and interest groups; and 2) Involvement was characterized by the nature and extent of the public's participation in problem solving and decision making. To follow this strategy required a series of public workshops/open houses, and evaluation meetings with local, State, and federal agencies. Public input was also obtained from written correspondence and comment sheets.

Public Involvement Strategy

In order to accomplish the above tasks, three sets of public meetings were designed. The first set, held in June 1994, was designed to educate the public and obtain information from them. The second set, held in November 1994 was designed to inform and obtain their desires. The third set, held in April 1995, was designed to provide the information and conclusions from the draft report, and to obtain from interested parties, their priority rating for Policies/Programs and Action Alternatives.

A master mailing list was developed from all five Districts, consisting of Federal and State agencies, Organizations and Interest Groups that had shown prior interest in the subject of floodplain management. The St. Paul District maintained the master mailing list in order to avoid sending duplicate mailings. The master mailing list, of approximately 200, was used to distribute the Milestonge Packages, notice of public meetings and other information. Each District also used supplemental mailing lists to include others who were interested and requested information about the Floodplain Management Assessment (FPMA).

Interagency Team Workshops with Local, State and Federal agencies took place during February 1994, August 1994, October 1994, January 1995, February 1995 and May 1995.

Three milestone packages were prepared and distributed to Federal agencies, State agencies, Organizations, Interest Groups, and interested individuals. The first milestone package (Existing Condition Identification Summary) was sent on August 5, 1994 to provide an update of the work being done on the (FPMA). Recipients were encouraged to review the data and offer guidance on revised directions, additional sources of information, or general comments for consideration. The

second milestone package (Problem/Issue Identification) was sent on September 15, 1994 as a further update and recipients were again encouraged to review and offer guidance, direction, or comments. The third milestone package (Alternatives Identified and Developed), completed January 18, 1995, was also provided as an update, with continued encouragement to review and offer comments. Questions expressed at the public meetings in November and written comments received through December were responded to in the 3rd Milestone Package. Several refinements to the study were made as a result of the comments received.

2. Institutional Analysis

General

An institutional analysis "consists of the identification and/or the creation of organizations and procedures that will be needed to effectuate the efficient implementation of formulated plans" (Taylor, 1977:122). "For the layperson an institution is the organizations, legal mechanisms, and the market processes that hinder or facilitate decision processes: (Dr. Peter J. Nowak, 1988 Great Lakes report). "Institutional arrangements are the 'rules of the game'. The rules dictate human behavior and help formulate expectations of the actions of others" (Frerichs and Easter, 1988).

An Institutional Analysis is an extremely valuable tool in evaluating how the floodplain players interact, and where there are contradictions and overlapping. Ideally, an analysis would cover the study area to determine if: (1) policies and authorities varied between States and units of Government (municipalities, counties) within these States; (2) floodplain strategies were compatable; and (3) various floodplain management approaches in relationship to land and water resources were effective.

Just as the focus of the FPMA study explored the systemic nature (whole system) of floodplains during the 93 floods along the Mississippi and Missouri Rivers; so too, the focus of the Public Involvement process required a look at the whole body of potential individuals, agencies, organizations and interest groups. The institutional analysis was considered an extremely important part of this process. It serves as a valuable tool in understanding, evaluating, and analyzing the institutional setting: legality and compliance, political conflicts, social and cultural values, and administrative effectiveness. "In our complex world, decisions which impact the public interest require complex coordination between all concerned interests, and due consideration of the legal and economic factors, political feasibility, and examination of the powers and authority of public bodies which are charged with responsibility for the public interest" (Bro et al., 1976:5). Politial interaction from indiviuals, groups, organizations is necessary for consensus building. Opposition interests which fail to show up at public meetings may surface later to stall implementation.

The success of any change in floodplain management will depend on gaining support from local communities and citizens since most decisions on floodplain land use is decided by local policy. Local communities must be actively engaged in efforts to work together to manage the health of the floodplain system. Communities, especially floodplain landowners, perceive the loss of jobs, economic productivity, and are reluctant to change, but communities really stand to gain the most from improvements that generate economic and community development (improved water quality and supply, improved recreational/ opportunities fishing/hunting opportunities, improved aesthetics and land values, etc.). River focused community revitalization projects work with bottom-up local involvement. Local communities will need support in making floodplain changes to maintain economic vitality, but it will require local empowerment, effective new incentives, the removal of disincentives, and effective implementation structures.

Inventory Data

Chapter 2 "Forces impacting uses of the floodplain" of the Floodplain Management Assessment report (FPMA) begins to analyze the floodplain forces by providing a historical evaluation of the study area, an institutional inventory, and policy and program evaluation. The institutional inventory is a list of institutions, organizations and groups and is located in this Appendix. The inventory list is only the first step in gathering data for the analysis. Because of the interrelated complexity of an institutional analysis, cost and time required for the analysis it was beyond the scope of the FPMA study. An unbiased, comprehensive institutional analysis would be necessary to fully understand and prepare for a new floodplain approach that would be supported. This would aid in reducing possible problems or preparing ahead to confront them.

The FPMA study has examined the forces impacting uses of the floodplain in chapter 2. Sections of this chapter include a Historical Evaluation, Institutional Inventory, and examined Polices and Programs. The Historical documentation includes a look at: (1) historical reconstruction to develop a picture of how the relatively undisturbed system functioned compared to how the system functions today; (2) historical data to document pre-project channel conditions, channel stability/instability, and identify patterns of development; (3) riverine-riparian biodiversity in the historic floodplain; and (4) an assessment of the relative impacts of dams, diversions, levees, and other impacts. The Institutional Inventory includes a compilation (list) of Federal, State and Local Agencies; Tribal Governments; Organizations and Interest Groups; Levee and Drainage Districts; Agriculture and Recreational interests. This list is available at the end of this appendix. A need for an evaluation of how these players interact, overlap, link together, or contradict purposes or goals still needs to be completed. The Policies and Programs evaluation has looked at the variations between States and Local units of Government; reviewed compatability of floodplain strategies; and looked at the effectiveness of various floodplain management approaches such as the National Flood Insurance Program. For a more in-depth analysis of the polices and programs see chapter 7 of the main report. As we have begun to analyze these floodplain forces (Historical, Institutional, Policies and Programs) we know that: (1) The extent of damages from flooding increases over time; (2) The responses to flooding are becoming more technical and sociopolitical; and (3) The institutional setting in relationship to flooding has become increasingly complex.

An evaluation is necessary to understand how differences in floodplain management will affect individuals and groups with different political systems. Conflict is unavoidable, but conflict between interest groups and agencies, as well as interagency conflicts need to be identified, and opened for discussion. Private interest groups/organizations, elected officials, and Government are competing interests. Better coordination is not the sole answer in reducing conflicting agency goals, missions, bureaucratic inertia and turf battles that prevent public agencies from effectively cooperating to protect complex river systems.

1993 Flood Impact on River Communities

Before the Great Floods of 1993 arrived, communities were dealing with major problems involving old infrastructure issues, and social and economic change. These issues and changes were accelerated due to unprecedented damage from the floods. Tough planning issues that needed to be dealt with quickly included: "resolving housing shortages, finding suitable sites for subdivisions and towns, finessing the financial resources to implement projects, building the necessary infrastructure to accommodate growth, and reusing cleared floodplain lands" (Morrish, Swenson, Baltus, 1994). The recovery process is far from over. "While the floods and the recovery process are felt most immediately in the community, their regional and national importance will only become more apparent with time.

From a preliminary needs assessment study of post-flood recovery planning issues at the community level, we can draw conclusions that have implications at the larger scale" (Morrish, Swenson, Baltus, 1994). Very little money has been made available to communities to plan for relocation, while millions were spent to aquire flood damaged properties. A very real problem exists in a relocation program when it moves parts or entire towns out of the floodplain without addressing what held that community together (common link, culture, bond or sense of belonging). All of a sudden that community quality is gone and individuals will feel displaced. People are a part of the environment and "communities need to be included if the entire ecology of the river is to be sustained. A sustainable balance with the environment is a crucial part of the planning process we have found so deficient, or missing altogether in changing and relocating communities. Holistic thinking is needed to plan communities that better recognize and enhance their connections with the environment" (Morrish, Swenson, Baltus, 1994).

3. Public Meetings and Workshops

Results of Public Meetings and Workshops

Summaries, comment sheets and other information from the June and November Public Meetings was submitted by each of the five Districts, and is included in order: Kansas City District Summaries; Omaha District Summaries; Rock Island District Summaries; St. Louis District Summaries; and St. Paul District Summaries. The April Public Meeting information and statistical packages for each District plus the overall statistical tabulation for four Districts is complied together under the April Comment Spreadsheets. Rock Island has a statistical program in which all their data results are complied.

From June 13 to June 30, 1994, 12 open house meetings were held in various locations throughout the study area (see figure 1 for locations). The Public Involvement point of contact representative from the St. Paul District attended most of the June meetings with each District's assigned public involvement person. The open house format was designed to educate, answer questions and solicit input. As interested parties entered the meeting they were shown a slide and audio presentation describing the background and reason for the study. They then had the opportunity to look at displays that included information on the objectives, study organization, study area, and related information. Four tables each had a subject expert available for questions along with displays of work by that discipline. The public was encouraged to ask questions and make comments at these tables. Flip charts were used to list alternatives and perceived needs. The public was encouraged to identify alternatives and needs or place a mark beside the alternatives or needs that interested them.

Overall, the comments were positive to the open house meeting because it assured more people could take the opportunity to express their views, and those people felt the meetings were educational and contributed to their understanding. Many of the open house participants provided comments either at the open house or mailed their comments later. The comments received were recorded in a computor matrix format. The Figure 2 pie chart shows the coded information from the matrix identified as the percentage of group representation that responded at the June meetings. The majority (34.1 percent) represented agricultural interests, while the second largest group (23.5 percent) was represented by self interest. The third largest group (17.4 percent) was represented by Government (separated into four groups: Regional/Local, City, County, and State). Other interests included: Environmental, Industry, Other, Private Interest Groups, Planning, and Mental Health.

A content analysis of the comments received from the June meeting reveals four underlying themes. First, there is the strong support among agricultural

FIGURE 2

interests for improving and continuing development of structural flood control measures, especially levees. Second, the environmental interests together with some agricultural and recreational interests tend to support the idea that greater enphasis needs to be placed on non-structural measures, particularly those that will provide environmental enhancement and benefits. Third, is that agricultural, environmental, and government representatives are asking for greater coordination among agencies responsible for managing the Upper Mississippi and Lower Missouri rivers. The forth theme suggested that there is genuine interest in understanding the flood of 1993. Other comments from the June 1994 meetings focused on specific problem areas, often calling for detailed solutions. Many of these comments have been addressed.

In November 1994, thirteen meetings were held at locatons within the study area (see figure 1). These meetings followed the same basic format: a set of slides and script provided by the St. Paul District. The Rock Island District varied somewhat by conducting a focus meeting before the public meetings were held to help clarify the format and style of presentation.

Many interested parties that attended the November public meetings voiced concern about a wide variety of issues involved in the floodplain study. Others provided written comments about their concerns. Some meetings were dominated by one main issue while other meetings had a wide variety of discussion issues. Comments heard from these meetings and the written correspondence has been recorded. Comments have been coded to identify the desires and concerns of all interested parties and are shown in Figure 3. The key to the pie chart is discribed in Figure 4a, 4b, 4c, and Figure 5.

The following discussion provides an analysis of the comments received from the November meetings. One of the limitations of this meeting analysis is it's subjective and anecdotal method of recording comments. However, representative summary of the comments heard can still provide some observations and reinforces the theme of the June meetings. The majority of comments revolved around (1) Levees, especially their good qualities and the value of the 500year levee . Other recommendations were to raise heights and build more levees. On the reverse side, some people thought levees were high enough but in need of better maintenance and improved interior drainage. Approximately a dozen people were in the middle: wanting to keep levees low and improve costs. (matrix codes: LVG, LVC, LVB, LMS). The second and third most often heard comments were concerning (2) Economics: costs vs. benefits and measuring impacts by dollars vs. acres (matrix code: ECON); and (3) Study: is it worth it, confidence level, need 4th scenario, very complex and hard ot understand (matrix code: STDY). fourth most often heard comment concerned (4) Environmental measures such as ecosystem concerns, culmulative effects , water quality and impacts to species (matrix code: ENV) . Other comments that were also reflective of an environmental position but placed in different categories include: encroachments in the floodplain (matrix code: DEV); optimum management plans (matrix code: OMP); the value of wetlands and river ecosystem (matrix code: WET); watershed management (matrix code: WS); social well being impacts (matrix code: SOC) and historic preservation (matrix code: HIS) plus a few others. A more detailed explanation and actual number of people responding to certain comments are shown in the Key to the Matrix Code, Figure 4a, b and c.

The third set of Public Meetings were held during the last two weeks of April, 1995. Eleven meetings were conducted within five districts. Handouts were available to the public at all meetings. They included the: Executive Summary, Hydraulic summary with tables of alternative actions affecting the floodplain, Findings, and Conclusions. Those in attendance were given a comment sheet to fill out before leaving the meeting. The presentation format consisted of a 30-40 minute slide show with a brief narrative. The slides were prepared so that each District could select from two action alternative case studies. The presentation was designed to educate the public by presenting the products from the study,

AALT - remove extreme action alternatives

AGR - agriculture benefited by levees; not enough about agriculture in this study; want regional versus national impacts in study; ag. subsidies; crops enhance wildlife; ag. protected as well as business; look at realistic ag. data - 5 to 10 yr. events; need ag. land in floodplain; rented land lost to the CORPS?; look at ag. practices in floodplain

BIOE - suggested use of nonstructural techniques by CORPS is one of best components of this study; use native vegetation in the watershed

BLD - build levees as HREP impoundments were done; lower road height; use water control structures to release water

BUF - buffer zone between waterways and tilled land; need buffer strip at least 60 ft.; better enforcement of buffer zone

CHF - levee channeling causes increase flow/volumes down river

CORP - well received at meeting; generally support study

CRIT - critical facilities considered priority; combine critical and priority sites; better explaination

DEV - encroachments in floodplain/river; embankments; 'hard surfaces' decreasing rainfall infiltration and increasing flood events?; construction of I-635 bridge caused increase flooding; took ag. land for development

DRE - dredged sand should be used on levees/ or completly removed; reduce dredging

ECON - cost/benefit to floodplain or land developed behind levees; benefits may not equal B/C ratio requirements (Do analyses favor those impacts that are easy to quantify and undervalue those that are difficult?); data does not allow complete analysis or by specific hydrologic setting; need higher estimates in modeling the impacts of watershed runoff reduction estimates; reduce FED. expenditures; need consistent funding; use a lottery system to raise capital; compare transportation cost of export grain shipped by barge; need better values placed on wetlands; difficult to measure dollars against acres

ENV - environmental values; impact of flooding on species; declining ecosystem; changes in aquatic ecosystem; water quality should be impact; consider the Draft Environmental Impact Statement for this study; include impact of flooding to wildlife; address culmulative effects to environment; more aggressive strategy to protect wildlife likely as shift seen in national policy

FE - look at using other flood events other than 1993 flood; impact of those on wetlands, tributary flooding and high water on uplands; flood control should be analysed

FER - flooding improves land fertility; promote cyclical flooding of agricultural lands

FF - oppose limited flood fighting

FLD - field studies in various land management practices on flood dynamics are needed in a variety of physiographic regions; comparison of standard project flood control levees along the UMRS.; need flood hazzard mapping

FP - floodplain; use of area for extreme flood events; lost storage capacity; move people out of the flood prone areas; need to study individual floodplain characteristics

- FST fast and more financial response action post flooding
- $\ensuremath{\mathsf{HDW}}$ flood damage reduction strategies needed in the headwater and on the upland floodplains
- HIS historic preservation; sites protected; look at historical flood damages
- HO low cost housing outside of floodplain; housing location suggested in Galloway study
- HYD consider the hydraulic distribution of flood damages; specific hydrologic setting, such as the watershed scale or flood magnitude, better modeling studies needed like the Hydrologic Simulation Program for Fortran (HSPF); dams altered hydrology of mainstem rivers
- INS insurance rate costs; claim costs; crop ins. required residences too?;
 Gov't should not pay flood insurance
- LMS build levees as on the lower Mississippi; rebuild levees
- LVB- bad about 500-year levee; flooding behind; maintenance and improvement; private levees bad; use of 500-year seems excessive; don't build higher; interior drainage problem; why push back ag. levees but not urban levees?
- LVC levee, maintenance/improvement costs; study individual levee districts; clarify max. height; change slopes; keep levees low; either 500 yr. or NO levees; no segregation of urban/public levees
- LVG good about 500-year levee; value to navigation; set back from waterway; raize levees; maintain levees as is; need levees; repaired levees
- MM mismanagement by Feds, give to locals to manage; water control plan for Missouri River manual appears over influenced by Upper Mississippi executives and deters Lower Mississippi residents of their rights
- MTG public meetings good idea but response to format negative; use microphones for speakers and questions; too abstract; show slides that show work completed and make it more interesting to public; visual aids important!; no facts just PR at this session; interesting mtg.
- NAV impact of navigation projects, channeling, wing dams on flooding; value of nav.; expand nav. study to restore river dynamics; scenarios applied to nav.; consider long term impacts; determine the impact of cumulative effects from continued or increased navigation
- ${
 m NS}$ return rivers to there natural state (natural state not defined?); simulate natural geomorphological process
- OFC other flood control; other management than use of floodplains OMP strive for optimum management plan, use watershed management; CORPS experts so willing to work with them; CORPS should make all an inter-agency endeavor with USFWS, DNR, SCS, etc. as in other areas of country; need third party peer review; require a national balance of standard project flood protection to navigation, economic development, and environment and habitat protection; avoid agency self-interest multi-agency; Gov't work with communities
- PC more pollution control for river waterPOL policy defined through district or river mile, (same?)

PPR - value of property in floodplain, private property rights; treat landowners fairly

REC - provide recreation, hunting, fishing, boating, etc.; consideration of ease
of access by elderly, disabled, and non-boaters
REG - consistency in Gov't regulations; need uniform, standard, Federal
policies; want Gov't. ownership of floodway

REM - remove structures from floodplain; buyout

RES - use water reservoirs; may invite criticism; Pick-Sloane plan; reservoirs are proven to reduce flood damages;

RO/DR - stormwater run-off (urban and agricultural), use of upland measures, agricultural run-off problems; tailor to a variety of flood magnitudes; soil conservation and enrichment to prevent runoff and sedimentation buildup in rivers; address drainage problems

RR - reroute excess water to dryer areas
RVR - river wide policy, not separate for upper and lower; change river
management

SOC - social well being impact category; human value is not given enough importance; unclear what significance short and long term human trauma damages are caused by large flood events; human beings have a right to be protected; solution the same for everyone; equal representation; focus on social issues; moving out of floodplain

STDY - study, what will happen when it is completed? is it worth it? study nothing but public reaction placating, no confidence; need more time to collect data; study seems to cover too many issues/solutions; Will plan work? - too vague; don't misinterpret the data; potential benefit of study; very useful; HEC-1 modeling underestimates flood peak reduction; 3 scenarios - need better description; the three scenarios presented at the meeting raise some additional issues that must be studied as a comparison of floodplain management policy; need 4th scenario; very complex study- needs more funding

STRC - Corps should consider impacts of a maximum structural flood control approach versus the current bioengineering approach suggested

TRAN - water transportation important; address transportation impacts separately; determine future of Miss. river; increasing river traffic causes ecosystem decline (wind/wave action)

TRB -consider tributaries for importance, large amount of 1993 flood occurred in these areas, small watersheds

URB - urban protected areas; include/expand traffic corridors;

WET - value of wetlands, use as leased areas for water storage, habitat; large-scale restoration of pothole wetlands; benefits of ground water recharge and flood control; increases water quality; include all wetlands; management of river ecosystem to floodplain is unclear

WL - water levels, need more capacity adjustment capabilities, clean out backwaters; change water levels in pool, make channels deeper, wider

WS - watershed management approach; need to take specific watersheds into account; future watershed study needed with a complete analysis of the distribution of cumulative historical flood damages within specific watersheds; storage capacity; integrate other studies; use of upland watershed reduction a plus; evaluate groundwater surface interactions; water supply

CONCERNS EXPRESSES IN NOVEMBER MEETINGS AND WRITTEN CORRESPONDENCE

COMMENTS EXPRESSED WERE GROUPED INTO COMPATIBLE CATEGORIES AND SHOWN AS A PIE CHART GRAPHIC. CATEGORIES WERE ESTABLISHED FROM GROUPS OF COMMENTS THAT WERE SIMILIAR IN NATURE AND CAN BE REFERENCED ON PAGE 2 OF THE Key to Matrix Code. Categories follow:

Desires of public:

1) FAVOR NON-STRUCTURAL FLOOD CONTROL: BIOE - LVB - REM - NS - BUF

2) FAVOR STRUCTURAL FLOOD CONTROL: BLD - LVG - LMS - STRC - RES - RR -

3) FAVOR WATERSHED MANAGEMENT WS - TRB - OMP -FE -HDW - RO/DR -

Concerns of public:

1) AGRICULTURAL CONCERNS: AGR - FER -

2) ENVIRONMENTAL CONCERNS: WET - PC - ENV - HIS - SOC -

3) ECONOMICS CONCERNS: ECON - HO - INS - LVC - FST -

4) STUDY CONCERNS: CORP - STDY - MTG - AALT - FF-

5) RIVER MANAGEMENT CONCERNS: CHF - DRE - TRAN - WL - MM - NAV - REC - RVR - REG - POL -

6) FLOODPLAIN CONCERNS: DEV - PPR - FP - URB - CRIT - HYD - FLD - OFC - existing base conditions, policy and program findings, and action alternative evaluations from the Floodplain Management Assessment (FPMA) draft report. After the presentation those in attendance were asked to complete the comment sheet; identifing their priorities on Policies/Programs and Action Alternatives, while keeping in mind that the goal of floodplain management was to (1) minimize the vunerability of people to floods, (2) reduce flood damages and costs, and (3) assure a healthy floodplain environment.

Responses to the comment sheet questions have been recorded by commputor, using a statistical package to quantify the results. The majority of the public meeting participants that choose to complete the comment sheets, represented agricultural interests. Agricultural interests from Rock Island, Kansas City, St. Louis, and the Omaha Districts had a combined total of 67% attendance, while the St.Paul District had only 5.3% attendance, pulling the total down to 54.68%. Other interest groups were not as well represented: home owners = 11.68%, government = 12.6%, and environmental = 5.8%. Priorities were ranked by individuals who attended the April public meetings. Overwhelmingly, all Districts gave a very high (5) priority rating to 1) protect critical facilities (56.4%) and upland retention and additional watershed measures (57%). Since the attendance at most meeting sites consisted of a majority of agricultural interests, correlations by other interest groups are not necessarily representative of the attitudes of a larger population sample. Therefore the measures of association here is limited to the agricultural interests only. Agricultural interests show an association with raising agricultural levees, but not with uniform levee heights, levee setbacks, or agricultural support policies. That interest group also shows a very low priority correlation with relocation and mitigation programs, wetland restoration programs, limited flood fighting and removing agricultural levees. An interesting observation shows that these associations get stronger further south (below Moline) on the Mississippi River, but are evenly distributed along the entire Missouri River in the study reach. The results of the tabulation by District, follows:

St.Paul District: Two meetings were held in St.Paul, Minnesota and in LaCrosse, Wisconsin. The number of people who attended was a small but diverse group.

Attendance: total of 27 Responses received: 19

Primary interest of respondents:

Agriculture 5.3% Commercial 10.5% Government 26.3% Home owner 26.3% Environment 15.8% Recreation 5.3% Other 10.6%

Where respondents live:

Outside of flood plain 57.9% Unprotected urban flood plain 26.3% Protected urban floodplain 5.3% Other 10.5%

The following priorities were rated by the respondents on an increment scale from 1 to 5. A very high or very low indicates that more than 50% rated the issue either 5 (Very high) or 1 (Very low). A high or low indicates that more than 50% rated the issue 4 or 2 (above or below neutral).

Priorities on program and policies:	St.Paul	LaCrosse
National flood insurance	***	
	High	
State flood plain management	High	
Local flood plain management	High	High
Relocation and mitigation	High	
Disaster relief programs		Low
Flood plain wetland restoration	High	High
Agricultural support policies		Low
Priorities on alternatives:		
Limit flood fighting		
Remove agricultural levees	Low	
Agricultural levee setbacks		
Uniform levee height		
Raise agricultural levees	Low	Low
Raise urban levees		
Protect critical facilities	High	High
Upland retention	High	Very high

A correlation between the respondents' primary interest and how the issue was ranked showed differences in opinions. Associations between interest groups and their priority ranking of 1) policies/programs and 2) alternatives are shown below:

Interest Group	Environmental	Government	Home
National Flood Insurance	High		Very high
State flood plain management	High	High	Very low
Local flood plain management	High	High	Low
Relocation and mitigation	High	High	Very low
Disaster relief	High		Very low
Floodplain wetland restoration	High	Very high	
Agriculture support policies	Low		Very low
Limit flood fighting		High	
Remove agriculture levees	High		Low
Agricultural levee setbacks	High	High	Low
Uniform levee height			Low
Raise agricultural levees	Low	Very low	Very low
Raise urban levees			Low
Protect critical facilities	Very high	Very high	
Upland retention	Very high	Very high	

Rock Island District: Three meetings were held in Moline and Quincy, Illinois; and Burlington, Iowa. The majority of respondents attending were representing agricultural interests. It must be cautioned that the numbers for those who indicated a primary interest other than agriculture are relatively small and the results do not necessarily reflect the attitude of a larger population.

Attendance: total of 167 Responses received: 145

Primary interest of respondents:

Agriculture 61% Government 10% Home owner 10% Environment 6% Other 13%

Where respondents live:

Protected agricultural flood plain	47%
Outside of flood plain	37%
Unprotected urban flood plain	88
Other	88

Priorities were rated by the respondents on an increment scale from 1 to 5. A very high or very low indicates that more than 50% rated the issue either 5 (Very high) or 1 (Very low). A high or low indicates that more than 50% rated the issue 4 or 2 (above or below neutral).

Priorities on the policy issues were fairly mixed. Only local floodplain management received a high rating with more than 50% of the respondents listing this policy as a 4 or 5. Only relocation and mitigation and floodplain wetland restoration received low ratings.

The opinions on alternatives were more clear cut. This was primarily because the issues were more understandable and could be perceived as having a more direct effect on the respondents. Levee setbacks received the only low rating while all of the others received high ratings. Clearly, raising levees, protecting critical facilities and upland retention were the preferred alternatives. Results by meeting site are shown below:

Priorities on program and policies:	Moline	Burlington	Quincy
National flood insurance State flood plain management Local flood plain management Relocation and mitigation Disaster relief programs Flood plain wetland restoration Agricultural support policies	High High 	Low Low Low	High High Low Very Low High
Priorities on alternatives:

Comments Expressed - Spreadsheets and Statistics

During three public meetings/workshops and during the time periods following the meetings comments were collected and formated into comment spreadsheets and statistical data. Comment sheets were filled out at the June and April public meetings, and written correspondance received was also tabulated into the spreadsheets and statistical data. The coded matrix spreadsheets from each set of public meetings along with written comments from Individuals, State and Federal Agencies, and Interest groups are included as an attachment to this Appendix D: Floodplain Management Assessment Report for the Upper Mississippi and Lower Missouri Rivers.

4. Findings

***Comments heard and read throughout the public involvement process confirmed strong support for three main themes: 1) levees among agricultural interests, 2) non-structural measures and upland watershed management plans by all interests, and 3) agricultural, environmental, and government representatives are asking for greater coordination among agencies responsible for managing the upper Mississippi and lower Missouri rivers.

***Overwhelmingly, the priority response from the whole region, at the April public meetings, was to 1) protect critical facilities and 2) use upland retention and additional watershed measures.

**The success of any change in floodplain management will require complex coordination between all concerned interests (public agencies, private interest groups/organizations, and local communities). Throughout all the meetings and from written correspondance interest groups were asking for the opportunity for more involvement in the assessment process. Partnering efforts to determine future management options were mentioned often.

**Desire for total watershed management was as strong an issue as the desire for structural flood control.

*Any relocation/mitigation program needs to serve the floodplain communities by providing financial resources for planning for the cohesiveness of that community.

Floodplain Management Assessment

Second Series Open-houses

Public Comments

Topeka, Kansas, November 9, 1994

The impact of the mental health issue would be useful to local mental health agencies to provide services. I am curious as to the money spent on these studies and what will actually be done with the river. The study should be interesting, but if the recommendation of best scenario isn't followed, what good did it do?

###

I think it's vital that intense effort be made to study the sociological effects of each of the scenarios on local populations.

###

Overall looks like a good plan. At some point, make data collected available to the States, others. Even if the data is not precise, it would be helpful. Although you man need to aggregate results in the end, display them separately as well (local data is more helpful to locals). A look at a less frequent event could have substantially different results. A look at another event (perhaps a separate one for each region) could be quite helpful. Might be a good follow-up study.

###

You aren't looking at realistic agricultural data. Many of the ag levees are only for 5- or 10-year events. Why is the smallest event a 25-year event? The Missouri River Master Manual study needs to look at higher flow. Not just low flows. You should separate the tables by State or District. Parts of the table are valuable, not the whole. You should be looking at more than just the 1993 flood event.

###

Kansas City, MO, November 10, 1994

No floodplain assessment can be proper or complete until you factor in the results of an ever-changing (more development) watershed. It may be that the Government (Fed., State, or local) would own the floodway (say 25-year) and levee the 100- or 500-year floodplain area outside the floodway.

Attached letter on legal status of damages from the operation of revised flood control manual. Basically we like the original manual better than the revised manual. In area south of Ft. Gavins, we are very interested in flood control which would supply adequate economical water supply for industry and public uses from Gavins Point to New Orleans.

Text of encrosure:

October 12, 1994

U. S. Army Corps of Engineers Missouri River Division Public Affairs Office 12565 West Center Road Omaha, Nebraska 68114-3869

Colonel Thuss Duane Syeumn

Gentlemen:

I am completely dissatisfied with the proposed manual for Water Control of Missouri River.

It is apparent in the development of this Manu, that the sports enthusiast and Upper Missouri River executives were in control when the Manual was developed.

The Corps of Engineers are to be congratulated for the control of low in the past. it is the belief they are influenced by people form Upper Missouri River Basin.

What can the residents of the Lower Missouri Basin and Mississippi River Basin from St. Louis to New Orleans do to voice their rights?

Let us discuss what has been done in other areas of United States and the Supreme Court to f United States. In New Jersey the United States Supreme Court reversed a Lower Court decision to deny right of property owners to reclaim their property which had been classified as wetland.

On June 24, 1994 the Supreme Court ruled five to four that a Public entity taking of uncompensated property is in violation of the Fifth Amendment to the U. S. Constitution.

In majority opinion, chief Justice William H. Rehnquist elevated judicial scrutiny of property cases, saying the Fifth Amendment should not be a poor relation to such liberties as free speech and protection against search and seizure. The opinion underscored the right of property owner, to keep other people off of your property.

A Federal Appellate Court recently held that Congress did not intend for the Endangered Species Act to require landowners to provide habitat.

Gentlemen, which includes suppliers of water, electricity, public services, farmers and concerned citizens from Omaha, Nebraska to New Orleans, Louisiana in the Missouri and Mississippi Valleys. I urge you to organize and stop these organizations and individuals who take and damage our property.

Sincerely yours.

###
Change in Flood Plain caused by I-635 at the Missouri River in Riverside, Missouri. Relocation of levee and set-back for floodway. Protection of critical sites (sewer plant). In Parkville, the Corps of Engineers on several occasions miscalculated how high the water would reach.

When describing impact of each scenario, try to show both regional and National impacts on agriculture. Please feel free to contact me if we need to coordinate any GIS/data on expenditures.

###

Text of letter from the City of Parkville:

November 10, 1994

To the U.S. Army Corps of Engineers:

I understand that the levee at the I-635 Bridge is 800 linear feet short of the requirement to carry water down the Missouri River, without backing up the flow. This apparent error escalated the flood of Parkville's shopping district in 1993.

We fear that any new levees or increased size of levees may further escalate the flooding of Parkville if we revisit the same conditions which contributed to that most recent flood.

Parkville has no levee and no place to build one. We have two creeks coming into this small area, and it is not practical to build levees.

The 1951 and 1952 floods created only 3' of water in the low areas of Parkville while the 1993 flood created 11' of water in the same area because of the backup of I-635.

I would ask that you take these facts into consideration when reviewing the need for new levees of increased size in this area. We also request that we be notified of and permitted input into any further discussions on this topic.

Thank you,
/S/
William M. Quitmeir
Mayor

###

I do not understand how the Corps can discuss and consider alternatives of flood plain management without considering the Draft Environmental Impact Statement recently released. This is like one hand doesn't know what the other is doing! Both of these studies are done by the Corps and should be taken into consideration. This is a good example of governmental waste. It

CEMRK-EP-PF 29 November 1994

would also help to have <u>informed</u> people lead the discussion -someone who knows something about what is going on! This was
better than the one held at the Embassy on the Plaza some months
ago. However, there is great room for improvement in the format!

St. Louis, Missouri, November 15, 1994

[No written comments from the St. Louis meeting to date]

Jefferson City, MO, November 16, 1994

As farmers we would like to see the river management left as it is now. We know when excessive rains come, the river will have to flood. The levees as we now have protect us from the small overflows; to build them higher would be crazy. To increase the flow during March, April, May and June is the very worst time to do this. Let's keep it like it has been in the past as navigation can continue well into the harvest season. Callaway County cannot afford to lose the tax base of our agriculture land in the river bottoms. ###

Economic Impact on Recreation vs. Commercial in your 3 scenarios:
Recreational Economy of 500 mi. of Upper Mississippi in
1992=\$492 million whereas Rec. Economy on 500 miles of Mo River
in Missouri in 1992=\$2 million.

Conclusion: Due to former decision to MANAGE the Lower Missouri as a confined barge canal, a vast untapped recreation economy is being held hostage by the outdated ropes of an agricultural/commercial river management paradigm that NEVER has materialized and therefore should be abandoned in favor of movement toward your scenario 3###

Believe the meetings are a good idea. I went to the earlier version in Jefferson City also. I am particularly interested in the Osage Delta area and its diversion structure. All our agricultural levees have been repaired by the association. I am interested and willing to work with the Corps of Engineers on anything dealing with Osage County. (I am a high level Rec Cross disaster worker and chairman of the Osage County Unmet Needs Committee.)

Ag levees should be kept at 25- to 100- year flood height. Some leveed areas do not justify the 100-year height because of size of the area protected. Commercial buildings should be allowed only in areas protected for 500-year floods. New residential buildings should have 100-year protection. Old residential buildings should be allowed to stay if not badly damaged and be

covered by flood insurance. No attempt should be made to make the lower Missouri into the 1900 riverbed. In other words, please do not make a giant step backward.

Omaha District Summaries

CEMRO-PD-A (10-1-7a)

9 December 1994

MEMORANDUM FOR CENCS-PE-P (Dave Loss)

SUBJECT: Flood Plain Management Assessment (FPMA) Public Workshops

1. The following are comments made at the Omaha District FPMA public workshops held in Nebraska City on 14 November. The majority of those attending were farmers, including the representatives of city and county governments. Attenders provided input on policy issues, causes of flooding, solutions, and additional information.

2. Comments relating to policy issues:

- a. Farmers who received disaster assistance in 1993 were required to purchase crop insurance in 1994. Were people who received disaster assistance for their residences similarly obligated to purchase flood insurance?
- b. Many farmers resent the push to realign the agricultural levees in order to spare urban areas, when in many cases these urban areas have failed to properly enforce zoning rules and have built into the floodway.
- c. There is often an SCS requirement to establish a buffer zone between waterways and tilled land. This needs to be better enforced to prevent erosion, sedimentation, and polluted runoff.
- d. Some people maintained that no private levees should be allowed between the river and federal levees. If the private levee was there first, the government should buy it out. The reason for this feeling is that the private levees cause a rise in stage, which causes seepage behind both levees. (See 2b below.)
- e. There was some support for higher flood insurance premiums in areas of higher risk.
- f. Dissatisfaction with the job done by some (not all) private levee districts was expressed by many attenders. There is a feeling that maintenance and repair is not being done, that the tax paid by those in the levee district is not providing a service. These people want the Federal government to have a way to enforce levee district responsibilities.
- 3. Several causes of flooding were presented.
- a. The original Pick-Sloane plan called for floodways three times greater than there are now, and the problem of interior drainage was not a problem addressed in this plan.

- b. Siltation of the river-side of levees decreases channel width, increasing water surface elevation and hydraulic pressure. There are now times that the water level is higher than the land inside the levees, causing seepage in the "protected" areas, which in turn exacerbates interior flooding. This is a problem with both federal and private levees. Must make levees far enough back that they don't get silted up right away.
- c. Local flooding problems are exacerbated by encroachments into the channel, by development, and by bridges and their erosion control (riprap), which narrow the channel.
- d. In many places, levees retained interior flooding even after the river receded. Are the drainage structures adequate for their purpose? Although the problem is most severe with private levees, federal levees have contributed to this problem.
- e. It is possible that highway and interstate embankments are having a severely negative effect on drainage. (This was perhaps true of the events of 1993, but not of more frequent events. Drainage is taken into consideration in roadway design.)
- 4. Some solutions to the problem that were offered were a dam on the Nemaha River (a major tributary of the Missouri River), leases of wetlands for habitat and water storage, and the Missouri River Corridor concept (restrict development to help preserve historic and cultural resources and provide recreation to attract tourists, as well as reduce damages).
- 5. The meetings were also opportunities to gather more information on the effects of flooding on land and water resources.
- a. An unexpected result of the sediment deposits on the fields: After 2-5 feet of sand was removed, the remaining sediment actually improved fertility in the flooded land, suggesting that fields should be let to flood every ten years or so, with help to remove sand from the surface. Data to support this might be obtained by comparing per-acre yields in the flooded areas before and after the flood, but hail storms, dry or very wet weather, or other events might obscure the data. (On the Platte River, which experienced spring flooding, the possibly enhanced fertility was overshadowed by the weeds sowed by the flood waters.)
- b. The economist got lots of good information about crop yields, land use, and flooding history.
- c. We spoke to a man who had been a commercial fisherman on the Missouri River, and got lots of valuable information about fish species, habitats, and the effects the changes on the river have had on numbers and varieties of fish.

6. Suggestions for the next meeting: Our efforts were overshadowed by the Master Manual Review process. The navigation study probably had a similar effect on the Mississippi River meetings. We may need to model the items of particular interest (in Omaha District, the effect of higher releases in the spring on Missouri River height and tributary flooding) to be ready to respond to concerned citizens. I do not think it is fair to just tell them that some other group is handling the issues: We are the Corps, and as an organization we look better if we know what the Corps is doing and why. Perhaps representatives of the other ongoing studies can accompany us to the workshops.

The Public Involvement Work Group designed its program to meet the study objectives; particularly Objectives B. and F:

Identify and array the desires of interested parties within the study area.

Evaluate and prioritize alternative actions based on consultation and coordination with Affected Federal, state, and local entities.

In order to accomplish the tasks, three sets of meetings were designed. The first set was designed to educate the public and obtain information from them on their needs. The second set was designed to inform and obtain their desires. The third set was designed to provide draft information and obtain priorities from the interested parties.

The Rock island District held a series of four public meetings in June of 1994. There was both an afternoon and evening session of each meeting.

Moline, IL

Burlington, IA

Quincy, IL

DesMoines, IA

A mailing list was developed from the Rock island Districts master list. It consisted of all individuals on the list that lived in the study area as well as all study area communities organizations and communities. The St. Paul District maintained the list of national organizations and state and Federal agencies in order to avoid sending duplicate mailings.

The meetings were an open house format designed to educate, answer questions and solicit input. Those entering the meetings were shown a video describing the background and reason for the study. They then had the opportunity to look at displays that included information on the objectives, study organization, study area, and related information. There were also four tables with a subject expert at each one with displays of the work of that discipline. The public was encouraged to ask questions and make comments at these tables. There were also several flip charts which had an initial list of alternatives and needs listed. The public was encouraged to identify further alternatives and needs and to place a mark behind those that most interested them.

What was heard at the meetings is reflected well in the comments taken from the flip charts.

Those now protected want a higher level of protection.

Do more to stop the rain where it falls.

Those not protected want to blame someone for the flooding; the Corps manipulates the pools, without levees there would have been no flood.

Overall, the comments were positive for having the meetings and listening. There was little unexpected. We received 215 responses to our survey on the meetings, about 67% of attendees. The results are shown on the attached summary.

65% found the meetings educational, 10% did not.

57% have a better understanding of the FPMA, 15% do not.

56% had their questions answered satisfactorily, 11% did not.

79% had ample opportunity to make their opinions known, 9% did not.

The last issue is most important for this meeting. This was an excellent format to assure that 320 people would have such an opportunity to make their opinions known. Based on observations, the 9% did not want or take the available opportunity.

The second set of meetings was held to provide further information and study status as well as to develop an initial screening of the desires of the interested parties.

The Rock island District held three public meetings as follows:

November 21 in Burlington, Iowa

November 22 in Quincy, Illinois

November 29 in Moline, Illinois

There was no meeting held in Des Moines since the June meeting there was not well attended.

The format of the meetings varied somewhat from the meetings held in other areas. This was due to the results of a focus group meeting held on November 2nd in New Canton, Illinois. This meeting was held with a random sample of people who had attended the June meeting in Quincy. The purpose was to get recommendations on a format and style that would be most acceptable, understandable and result in the best public input.

The meetings used the basic slides and script provided by the St. Paul District, modified to meet the recommendations of the focus group. The major change was in the description of the matrix and use of scenarios. The focus group felt that the matrix was not useful without the data. No priorities could be given to scenarios unless the data was available on impacts. it was felt that the best format for the meeting was to describe progress to date, describe the alternatives and discuss the concept of scenarios. The public could then offer opinions on alternatives as they related to their interest. this would then allow for scenarios to be developed that related to the various interests in the flood plain.

The results of the meetings indicated that the farm interests wanted to see levees raised to provide better protection. There were some negative comments related to the development of scenarios by groups who were not a part of the public meeting process. There was also concern that there was not sufficient data to present on impacts and alternatives.

The primary concern however was on how the scenarios would be presented at the next set of meetings. the public wanted to be assured that the data would be available and the information furnished prior to the meetings so that the public had ample review time before being asked to prioritize the scenarios.

It was obvious that the three scenarios presented was not sufficient for the public. A do nothing scenario is unacceptable to many. The moderate scenario is perceived by many to be only a follow-up to the Galloway Report and a scenario to meet the desires of the UMRBA and the Association of Flood Plain managers. The third scenario is totally unacceptable to most of the flood plain residents. There was no perception of a scenario that met the needs of the flood plain residents as reflected in attendance at the public meetings.

On each afternoon prior to the meetings, an opportunity was available to meet with agencies and interest groups. The first meeting in Burlington had no one in attendance. The meeting in Quincy had three people attend; a representative of the Upper Mississippi River Flood Control Association, a contractor for the Illinois DOT, and a representative of wetland interests.

The meeting in Moline had a representative from FEMA and one from the Dept. of Agriculture. Both of these meetings resulted in good discussions of the issues and provided valuable information to the study team.

The information gathered at the meetings in the Rock Island District is summarized in the following table:

TABLE IN EXCELL

SUMMARY OF APRIL MEETINGS PROVIDED AFTER MEETINGS.

SUMMARY OF FPMA NOVEMBER PUBLIC MEETINGS ROCK ISLAND DISTRICT

The Rock island District held three public meetings as follows:

November 21 in Burlington, Iowa

November 22 in Quincy, Illinois

November 29 in Moline, Illinois

There was no meeting held in Des Moines since the June meeting there was not well attended.

The format of the meetings varied somewhat from the meetings held in other areas. This was due to the results of a focus group meeting held on November 2nd in New Canton, Illinois. This meeting was held with a random sample of people who had attended the June meeting in Quincy. The purpose was to get recommendations on a format and style that would be most acceptable, understandable and result in the best public input.

The meetings used the basic slides and script provided by the St. Paul District, modified to meet the recommendations of the focus group. A copy is attached. The major change was in the description of the matrix and use of scenarios. The focus group felt that the matrix was not useful without the data. No priorities could be given to scenarios unless the data was available on impacts. it was felt that the best format for the meeting was to describe progress to date, describe the alternatives and discuss the concept of scenarios. The public could then offer opinions on alternatives as they related to their interest. this would then allow for scenarios to be developed that related to the various interests in the flood plain.

The results of the meetings is attached as well as the comments received. it was obvious that the farm interests wanted to see levees raised to provide better protection. There were some negative comments related to the development of scenarios by groups who were not a part of the public meeting process. There was also concern that there was not sufficient data to present on impacts and alternatives.

The primary concern however was on how the scenarios would be presented at the next set of meetings. the public wanted to be assured that the data would be available and the information furnished prior to the meetings so that the public had ample review time before being asked to prioritize the scenarios.

It was obvious that the three scenarios presented would not be sufficient for the public. A "do nothing" scenario is unacceptable to many. The "moderate" scenario is perceived by many to be only a follow-up to the Galloway Report and a scenario to meet the desires of the UMRBA and the Association of Flood Plain managers. The third scenario is totally unacceptable to most of the flood plain residents. There was no perception of a scenario that met the needs of the flood plain residents as reflected in attendance at the public

meetings. It is recommended that at least one scenario be developed to meet the needs as reflected in the comments of the public meetings.

On each afternoon prior to the meetings, an opportunity was available to meet with agencies and interest groups. The first meeting in Burlington had no one in attendance. The meeting in Quincy had three people attend; a representative of the Upper Mississippi River Flood Control Association, a contractor for the Illinois DOT, and a representative of wetland interests.

The meeting in Moline had a representative from FEMA and one from the Dept. of Agriculture. Both of these meetings resulted in good discussions of the issues and provided valuable information to the study team.

Quincy Meeting Evaluation Comments

I believe each district has different problems and Congress and other people don't listen to the people that have suffered and their problems are ignored. Listen to the sufferers.

No, lets get started soon to raise levees to 500 yr. floods

Core eng. blue the levee and took our cabin and 4 others we have not heard a word about paying for this large cabin worth \$100000 and \$8,000.00 in side. Did no about other meeting.

I think more of an agricultural effect of the flooding deeds to be presented to no ag community to get them to realize our side of the ramification. I don't think the environmentalists can grasp the devastations the flood had on all of us and they can't see the good we do. We need more media coverage-before & during the meeting.

All your questions are too general. You do not address the problems.—Don not include the river as flood management.—We need to manage the river.—Our area (Sny Island) is different then some district bur our area is not treated different. We have railroad, bridges, CIE a village of over 500, we need to protect these area's.

All studies are being done by engineers not from around here. Involve district engineers, involved people in the district.

This was a poor meeting. There must be specific areas dealt with and specific problems. You can't put 10 gallon in a five gallon bucket. Not even the Corps can do that. What's needed is a sheet showing how much taxpayer money has been spent on each district (drainage) since WWII index inflation into it, then see how many districts are willing to reimburse the taxpayers for these amounts. Would like to see cost sheets for each drainage district for 93 flood. Ollie l. Lymenstull 1806 Hilltop Quincy 62301

Make more of the information gathered during the studies public knowledge during the study.

No I don't if our suggestion are listened to.

These meetings need to be more focused per region.

Continue to keep the public informed.

We need a lot more news media involvement and announcement of meeting times and places. The facility in Quincy had no P.A. system and was hard to hear and understand questions and answers.

Publicize the meetings time & places better!—Put it on all TV channels on each news cast 6 & 10pm & 12 noon--We needed a PA system so we could hear

Get more hard facts at meetings--i.e. don't just take that suggestions

If you gave the amount of money spent on these "studies" to the communities impact by the flood of '93, responsible, practical, feasible solutions would be identified & implemented & we could all be done with this!

I felt it was adequate.

After the discussion, I re-evaluated my answers - and change some. Some more explanation of the (alternatives) choices would be helpful in evaluation.

Corp is too inflexible and public doesn't realize under what conditions you have to work—During Flood National Guard & Civilians learned to work together for the best of all concerned. They bent & we adjusted to their limitation with improved working

ability--Help people understand complaining to the Corps doesn't work - complain to Congress because they tell Corps what to do & what rules Corps works under. P.S. All done good job of keeping difficult condition under control during meeting.

Possibly state more clearly the purpose of these meetings - might become more informational rather than confrontational. Appreciate your help thus far.

Make the objective of meeting very clear.

Ouincy's Flood Plain Management Assessment Alternatives

Additional scenario 1) Aggressive project to improve level of protection for all existing levee districts

I can't evaluate any of these out of context.

I cannot believe that on policy of flood control could be fairly adopted to remedy all problems of the Upper Mississippi River corridor. I believe that each flood plain has it's own individual characteristics and problems to resolve. This questions asks the individual completing it to give answers to too broad of answers. It seems to give me the feeling that more consideration should be given to a through study of each flood plain as to if it needs partial levee set back and/or partial levee reconstruction, or even to the point of study of objects that could be restricting flow of water within the river proper itself -- such as low bridges, etc. Thank you.

The 1993 flood was the result of a low pressure area centering over northern midwestern areas. Rainfall amounts were much above normal. Every year more land is taken from production for building, roads, lots, etc. The government has promote no-till which causes water to run off quickly which is what happened in 1993. Because of these the river reached a level that n levees were not designed to hold. Because of the changes in our land we need to protect people down stream the present time we need to raise levees to the 500 year level.

We don't what the government to keep paying out in flood insurance, if we had the proper levee systems, we wouldn't have to call on the government to pay any claims. Also we wouldn't have the large expense that we had last year fighting the river raising our levees, then pushing them all back down. As far as the environmentalists are concerned--where do they think all the wildlife in these areas feed-is is off our farmland!! without it--if it were all wetlands-where would a lot of our wildlife get their support? Then we have our roads and bridges to consider--the country was practically disconnected between east and west due to the lack of transportation facilities when the river got the slightest bit out of its banks. I'm sure there was a tremendous financial impact.

Also what is the cost of a human life? Luckily we didn't lose any lives this time, but it drastically changed al to of lives not for the better--I thought we lived in a country where a human being was something precious (as much as a zebra muscle or wood duck) and we had a right to be protected. If we raised all the levees to the 500 year level, we could all live with it!

I feel this session was not a fact-finding effort, but rather a Public Relations effort in an attempt to placate those individuals directly affected the '93 flood.

Should address transportation impacts separately (not specified in presentation). urban/agricultural levees were segregated in presentation; this is not always the case Under urban levees--insufficient explanation of priority sites vs. critical facilities Presentation should have followed questionnaire more closely; it was too abstract. Very insufficient explanations of individual alternatives.

Much of the wording of alternative was ambiguous; the Corp personnel could not even explain them!

Why not raise the levees, have a one time cost instead of spending money on relocation of towns or financing and funding clean-ups, buy-outs, etc. after a disaster.

I believe raising the levees would be the least costly and do the most good.

I feel we need 500 yr. levee because dam's have filled the river up. Reservoirs are need and managed right.

Every 500 year levee held during the 1993 flood. This in itself proves the adequacy of a levee of that structure. It makes better economical sense to build these levees than spend more money on studies that will not solve anything and probably cost more in the long run.

Please, lets get started to raise levees to 500 yr. flood.

If all levees held in 1993 this county would have gained \$100,000,000.00 for taxed etc.! The river was bluff to bluff in 1993, so having no levce would not have helped!

When dredging the river put the sand o the levees instead of just moving it to another place in the river. Have 500 year levees for all. Make questions that make sense.

Have a five hundred year levees.

It is cheaper for govt, and better for wildlife to have levee protection. A 500 year levee is by far the best choice. The developed nation of the world all protect their prime farmland with levees.

This study is trying to address the flooding problem by regions instead of specific drainage district, or areas with special problems such. As Hannibal railroad bridge that holds water back this creates a very critical problem for everyone in the say island levee drainage district.

There needs to be greater consistency with the governments regulations and improvements to other business districts. It in itself is a mega-million dollar business. If various business can be given 500 yr. levees long with some urban areas then agricultural areas should be protected as well. There were levees constructed in these specialized areas with no comment or concern given to agricultural area and the land owner and drainage districts so effected; yet, we as a drainage district cannot even privately improve our own internal levees without a study being completed on how other downstream and else where might be effected.

New runoffs need to be completed to see if what we all assume to be a 100 yr. levee is indeed a 100 yr. levee and not possibly, today, a 25 yr. levee.

The environmental studies should include the impact flooding has on wildlife. Habitat is no created, but devastated to a point it takes years to recover.

Raise levees to 500 yr. protection.

Dredge river--place fill on levees. Let's don't get hung up on something as simple as improving our levee protection system. we must remember that levees protect wildlife, people, infrastructure, and homes. Yes--we can have it all-behind a good levee system. Let's invest in the future.

Please make it plain to the public just what phase each group plays in the scenario process such as TEMA, the Corps of Engineers, the government, etc.

You are playing with peoples' lives, land and livelihood--get specific and give specifics on meetings "behind the scenes."

I feel all scenarios could be applied to the Upper Mississippi River Navigation System. Some places may require 500+ year levees above bottlenecks, and some places may need the levee moved back. also is the railroad and other entities involved? I've lived and played in and along the river all my live, and I fully believe its holding capacities have reduced dramatically. I can't boat in the back waters because the islands have washed away and filled them up.

As for the Sny area, it can be solved by raising the levee to the 500 year levee. We have plenty of available sand in the river and equipment to put it on the levee -- sand on the levee.

The answer is not too difficult. We don't need any more surveys or studies and our tax money wasted. We need the river dredged and dredged material put on the levee. How can you justify spending \$500,000.00 to create a "moist soil unit" (or wetland) in our district when PEOPLE are still suffering from the efforts of the flood on '93. This is LUDICROUS!

I would also like to say that limiting flood-fighting in any area with towns, homes and farms will be strongly opposed!

Set a pool of funds like in Las Vegas where persons can "bet" for or against the river reaching a certain level in any one year. Wagers could be made in \$1,000 increments and based on actuarial odds.

Make them wider.

Make river deeper from shore to shore. Take river bottom and put on levees instead of making sandbars located just to the side of river barge channels. Too much Federal Politics Involved. Give the money to the local government because local govt. knows the needs. Federal Govt. spends too much time and our tax dollars on so called studies, surveys, and meeting to watch a slide program. Then when it's all over nothing has changed just more tax dollars wasted.

Kirk Rveb P.O. Box 142 Hull, Il 62343

Make sure the solution is the same for everyone.

Treat the upper and lower Mississippi system the same

When dredging river for barge traffic - what is dredged should be completely removed from inside levces so it does not fill up the inside of our levces.

We need a combination of reservoirs and 500+ yr. levees.

Quincy

For many years the Corp has dredged the river to keep navigation going. Why hasn't the material that was dredged, put on the levees to raise them? It seems like if this had been done over the years we would have had 500 yr. levees.

Why is our levee now lower then it was before the flood of '93?

We want more than a study—We need action for protection our homes, businesses and farms. We need a 500 year levee!

Raise levees to 500 year level. When rivers are dredged they should put material on levees. The most inexpensive solution in the long run is the 500 year levee. The environmental issue was it when it was flooded, there was no environment no habitual

500 year levee

- 1) The cost-benefit ratio must include all affected by the loss of a levee. Not just corn and bean but loss of beanstraption, jobs and etc.
 - 2) Keep building reservoirs on upland to slow water runoff.
 - 3) Build higher levees to get water down stream faster.
 - 4) Build higher levees to protect game and refuge areas.
 - 5) Build a system on the upper Mississippi like on the lower Mississippi.
- 6) Doing this will increase the economic value of the Midwest and return more money to US treasury then what a million dollar/mile levee costs.
 - 7) Build flood walk for cities.

Change River management, when dredging do not put spoil back in river—it reduces capacity of reservoir ability of river. Please consider human feeling and desires of losses an oz. of prevention would have saved rounds in 1993. Please consider agriculture as a business in evaluation. Flood affected nation—such as loss of highways. The levees were first built for flood protection. Please consider this—plus affect on cities not on river flood plains who depend on river barges for supplies. Study ways speed up response time to problems it just takes too long to respond.

Any flood proofing measures are a waste of money and infringement on personal freedoms. If one has had one flood insurance's clam then that should be it, but if I want to rebuild in the flood plain that should be my prerogative. if I do this I am on my own. No more claims.

We need to have either a 500 yr. levee or have no levees at all. Either way my village would not have had eight feet of someone else's water. We might have had on foot of our own but not seven feet of someone's else's water from up stream.

Change the inside slope to 3 to and the outside slope to 4 to 1 on all upper Mississippi River. Pump channel maintenance waste and sand to the top up the existing levees vs back into the river on the island for job security.

- 2-7 Agriculture is very important to this country and this land should be used and protected.
- 8-10 The urban area are spreading out; pouring more concrete--raising levees--putting in flood walls--hence-more water endanger farm land

- 11-14 From what I can understand we received great walls on water due to reservoirs being emptied--Kept high for recreation
- 15-19 Can't understand why and how the lower Mississippi has received 500 yr. levees and no one cares enough to see our levees done the same—clean out the runs bottom—Recommend to Congress to raise our levees to the 500 yr.—Meeting—waste of time. Recreation is more important than farms, animals and America.

Use money and time used to pump river channel toward raising levees. Use the same sand and put it to good use instead of putting it back in the river. It will increase wetland development at the same time.

We need to allow the sand from dredging the river to put o the levees and raise the land of the levee--This is the easiest, most economical long term solution to both river navigation problems and to raising fluid plain protection levees. This needs to be brought to the attention of Congress this option must be allowed!

Tell the Upper Mississippi River Ass. the report before the April meeting to respond directly to what is in the report. Thank you!

Agriculture levee's that also protect critical sites should be raised to 500 year level (Bay view Bridge Quincy Ill Faius Drainage Districts)

We need a 500 year levee. Dredge material from channel put on levee's.

These questions need to be much more specific!

We need to rename agricultural levees to (Federal Agricultural Commercial and Transportation Levees!)

These meetings are not getting to the heart of this matter. We do not really have a voice in this study. If the government was spending it's money wisely this study would be better designed to study specific area.

- 1) Why are there Environmentalists who work for the Corps--maybe there ought to be farmers and other businessmen to have representation their interest and not just on interest group.
- 2) Why is moving everyone out of the floodplain even a question? Are people who are affected by other natural disaster--like earthquakes and hurricanes not being allowed to rebuild or encouraged to move elsewhere? Flood planes are being singled out--unfairly. How can anyone be told where to live or where not live? Is this a free country?
- 3) Why are agricultural levees not given the same set of circumstances that urban and vise versa? (on the front of this paper)

Before the '93 flood, Paul Simon met with a group on the local near heyer, he said at that time, there's was enough studies on problems of the levees'—lets get something done.

This study is entirely too vague. I understand the mandatory constrainghts etc. but this can not be separated into urban and agricultural. The two overlap too much. How come urban level options are only about raising to 500 yr. when ag levee are being considered to be

eliminated. Industrialize there is probably more production and revere put into the GNP by agriculture areas protected by levee's vs all urban industries protected by levee.

Most reservoirs were originally built to control flood waters. Reservoirs should be right at extremely low levels instead of being kept at levels for boat and recreation. The public was originally ask for tax money for flood control not for recreation.

Make flood proofing measures use more common sense.

Put the sand while dredging channel onto the levees to raise them.

River dredging should have all material totally removed from the river and put again river levees.

QUINCY

Moline Flood Plain Management Assessment Comments

Are home owner, who rent their land from the Corps of Engineers, in jeopardy of losing their land to the Corps in this study and your recommendation?

This survey is very poor--not enough information to give meaningful answers. Need costs of alternatives also more alternatives.

The key must be flood plain insurance policies and then the hydrological implication of what one community (or individual) does that affects another community. If communities want to utilize land with the use of construction of flood walls they may have to assist other communities negatively affected by their decision's and hydrologic information should be made available to communities about those decisions.

Long range: We should utilize the Corps of Engineers to begin to take responsibility for publicly held railroad beds (just as waterways) in a concrete effort to make sense of transportation policies.

I. While the Galway report may have been hasty, it had the advantage of being on inter-agency study. Thus avoiding agency self-interest. This is a concern of many in the public relative to the Corps or any single agency.

II. This form is not a good instrument of opinion survey since its alternatives entail technical assumptions unknown to the public. The result will be a random spread of responses showing no trend in public opinion.

III. I generally favor a natural river system, but as long as the 9 foot canal system is an assured part of the system. I support the idea of a natural river is precluded.

To be accurate the enter basin needs to be studied not just the flood plan.

Removal of structures from flood plain. Buyout of wetland/flood plain area and allow to flood.

Existing flood plain development must be reduced only through buyout. New flood plain development must conform to a unified scientific plan enforced and consistently administered at state level or above.

Ag levees maintain at low levels so that farming works in dry years and flood storage is available in floods keep Ag supports dwellings and business upland> Provide workable funding to maintain drainage facilities at local level.

Urban levees only for business districts of communities of >200,000. Protect utilities health related facilities.

Have more consistent state and fed. flood aid. Money was actively being given away in 93 and absolutely unavailable in 94. Funds were marked for other purposes were misdirected in 94 because of the inconsistency.

Because of the potential for <u>negative</u> externalizes if different segments are allowed to have different flood plain management alternatives, it seems essential to me

that the recommendation be system-wide, i.e., a federal policy, not a series of state or more local responses. At least it must be system wide for each type of environment, e.g., one policy for urban areas, one policy about agricultural levees one policy about conservation/wetland areas, etc. For example, if one area has a build ag. levee high policy, thus channeling the water downstream, it would here average impact on downstream communities which might opt to allow lands to remain unprotected--which would cause damages and also distribute flood protection dollars unequally. In sum, there needs to be uniform, standard, federal policies.

Clean out back waters!

I think that the government should be ready to work with individual communities in how they decide to deal with flooding. Provide relief and planning accordingly.

Lower river levels to lowest possible level prior to heavy rain and run off periods. Better pool water height control. Stop barge traffic earlier and lower water levels prior to flood conditions.

All levees should be set at a uniform distance from river. Channelizing water isn't very wise. It need room to adjust to large volumes of water. Sediment is another problem. I think that if there was a law or regulation that all streams, creeks, rivers, etc., should have some type of buffer strip, at least 60 ft. at its banks. This would reduce sediment getting into the water and other impurities chemicals for example.

Added reservoirs 1) capture water for future use (as in drought) 2)increase inland recreation areas 3) allows for immigration efforts 4) would allow urban areas to expand 5) could be naturally or manmade in Northern Scott City and lower Henry, Mercer, and Rock Island Cties.

Example: Clarence J. Brown Reservoir in Clark Cty--Springfield, Ohio.

I am more interested in what local communities can do to mitigate the impact of flooding.

Build a flood wall (like in Cincinnati, Ohio)
Build reservoirs in Rock Island and Scott County. Better yet Henry Co.
Better drainage systems in Scott and Rock Island County.

It appears you are looking at a problem with the same policies which did not work originally. I think it would be important to do this study using not only the old policies but seeing what new policies could be created which would better suit a similar situation.

Some of these questions are rather vague--what exactly is meant by revise apparition of reservoir? I think that I understand most of these, but the information and solutions should be more descriptive.

Maline

Since flood plain wetlands are largely gone it would appear to be essential to maintain artificial ones—state and federally managed wildlife impoundments. When rebuilding levees around these areas the policy should be to construct them like some Corps built HREP impoundments, that is they should flood from the bottom end. They should have water control structures that allow slow release of flood waters after the river flow is moderated.

Important historical sites like Kaskaskia should be protected but generally only critical infrastructures should be given additional protection, key transportation features, etc.

You should look at lowering the profile of some roads crossing flood plains so that water can over top them.

Lost flood storage capacity includes wetland on croplands/former tall grass prairies, etc. not just flood plain. This should be taken into account in planning.

You are the ones with the knowledge--hold less weight on public opinion--it is a study not an action.

Burlington Meeting Evaluation Comments

Slides are good but need information on paper also

Be better informed, there were too many "Can't answer that", "Don't know" and "Can't tell you".

Have handouts of slides available at meeting!—I wasn't sure notes were being made to incorporate into study?—I presume this feed back was valuable?!

Burlington Flood Plain Management Assessment Comments

More data should be compiled about the recreational use and value of flood plain land before 93 flood hunting, fishing, eagle watching, boating, etc.

I do not feel confident that the study the Corps is compiling will have any "concrete" facts and figures. Everything is too "general". Many question did not receive an answer. If this is the way most studies are done and "major" decisions in economic development are based on-then they have lost my trust that they put any value on people.

As I listened to answers from Corp people I felt they were uncertain about the data they are using. This makes me very uncomfortable. It seems maybe more time should be allowed so that accurate data can be collected before this report is submitted to congress.

Check the river level today to what it was in the past. The river is filling up at a fast rate. We need to hold more water in each pool.

The Mississippi river System is a natural economic treasure for this country. Please work to insure it's usefulness as a connection between the most productive land in the world and foreign buyers. Water transport is less polluting and more efficient than any other farm at grain/wheat transport.

Revision of current formula for benefit/cost ratio needs to be made. Benefits should include value of infrastructure protected e.g. public utilities, public land, as well as substantial investment structures e.g. pumping stations and building price benefits to ag producers in other parts of the interior, prevention of loss of transportationial facilities e.g. closed highways and bridges and similar matters. Current formula is too restrictive and not comprehensive.

I consider the notches to be inappropriate. The only way this type of system could work is if the areas to be flooded were agriculture or green spaces with no buildings or dwellings. I can't believe that the NEIP would allow bedgs in this type of situation.

Route to desert/high population areas i.e. California, Arizona

*Need to emphasize importance of further studies to evaluate other scenarios. Flood of '93 was rare both in length of rainy period and severity.

*Also, it is not fair to consider some economics, but not value all factors because over simplification are inevitable.

**There is a critical need for development of low cost housing outside of flood plain. As outreach disaster worker many families rent and can not afford housing else where (also owners including elderly!)

I think the interested public should be made very aware of the extreme limitation of the Corps study. Versus the already widely published Galloway study. In the real

political world, the Corps study has already been evaluated simply because it has no specific concluding premise. Thanks for your time.

"500 year levee is the only way"

For the points marked neutral (excepting 16), there is a strong need for a real costbenefit analysis to determine what would be beneficial! The current study is not intended to do this. For point 16 there are several issues. It is pointless to par to rebuild structures in unprotected floodplain. Agriculture insurance should be paid repeatedly as real insurance. That is, fees set at a level to recoup costs.

Many comments necessary. Need to consider flood control as main theme and rather than migration or flood plain management.

Need to create definitions

Need to consider value of levees to navigation

Need to consider impact of various related lows on results it levee size and it impacts flood insurance rates and/or crop insurance rates

Need to approach idea of structure improvement

Need to discus what damages would have been (or not been) with more aggressive maintenance and improvement on levees over past 30 years

Need to consider private property rights

Need to consider value of stability in system (vs variable flooding)—to maintain business, social, environment and value of stable access to economic transportation (river)

B:fpma2

Moline Meeting Evaluation Comments

Need to provide more information and costs.

Yes hold meeting at the Mississippi Room at River Center in Davenport, Iowa Yes

Opinion survey form is poor—see my comments on the survey form. It contained technical assumptions unknown to the public and will not yield useful information.

Improve tributaries levees such as Green River

Need to have advance information of program format before next meeting

There were a lot of people present that didn't understand many concept. More back ground needed to be presented somehow. Panel speakers needed microphones. I understated the issues and I found this meeting somewhat confusing as to its purpose. I hope the April meeting will clear things up!

I believe more public comment and input would have been forthcoming if more developed plans were explained.

Better explanations--Real choices on questionnaire--Concrete uses for public opinion

Go slower in presentation of study--Distribute hand-out--Be more clear on relationship of this study (which explicitly is historical) to possible future changes (which clearly is the ultimate reason for this study)--Need to have more education about the alternative really mean/what they are.

Educate more about what the meeting pertains to. Many questions could not be answered because the study did not address the questions.

Explain the issues--public education--Solicit ideas and give them out so that people know what is going on--Slow down presentation - too fast to sink in--Have more meetings--Have experts in each field speak i.e. environment, economic, etc.

The average picture is well presented here, but we still need to address the local wetland problem, flood plain and river siltration, there are many river front property owners that are left out of consideration. What is really needed is more <u>local</u> information meetings. This Moline meeting does not address this area.

Better planning to handle water prior to flooding--reduce pools accordingly. Even is barge traffic is halted for a longer period.

Possibly show more slides that show the impact of the study -- More graphics. Improve tributaries rivers & dikes

1)Explain what congress asked the Corps to do exactly. 2)The objective of the report was not clearly stated. 3)The questions should be repeated so that everyone hears them. 4)The blue sheet needs explanation.

'fair' was my best assessment due to this being my first mtg. and unfamiliar w/terms

More information ahead of meeting for attendees to study.

A handout of some sort given before meeting starts would be very helpful & help new comers to the meeting understand type & issues at hand.

Have written information really when meeting begins. This was my first meeting. None--it was done well.

Present material to teach anyone the short of each presentation so a person with limited knowledge can learn what the processes at hand really are.

St. Louis District Summaries

CELMS-PD-F 17 Nov 94

MEMORANDUM FOR RECORD

TO: CELMS-PD-F FILES

SUBJECT: Public Meeting results, 17 Nov 94, Alton, Illinois.

1. Subject public meeting was attended by 39 citizens. Considerable interest was expressed in the technique the Corps intends to utilize in presenting the Flood Plain Management Assessment (FPMA) data and analysis.

- 2. The Corps presentation went quickly (about 35 minutes) and a lively and worthwhile exchange of questions and answers ensued. The citizens attending were sufficiently interested in the ongoing discussion to stay for about 3/4 hour beyond the 9PM closing time.
- 3. In summary, two specific citizen suggestions for improving the FPMA approach were as follows:
- A. It was requested that the Corps consider developing broad data that would discuss an important fourth scenario that is currently missing. The person suggesting the addition of a fourth scenario seemed to understand very well that the three scenario's currently proposed were a "backdrop" of local, State and federal policies and programs against which the various alternatives being studied would be evaluated. Further, he appreciated the current concept of Scenario #1 basically business without great change, Scenario #3 maximum environmental policies, and Scenario #2 something in-between. However, he believes the current approach to be flawed because we are not considering a maximum structural flood control scenario. He believes that to be fair and equitable, a counterbalance to the maximum environmental scenario is sorely needed. In summary, the concept was that as long as the Corps was considering a maximum environmental scenario (assumed to be maximum non-structural proposals), the Corps must also identify the impacts of a maximum structural flood control approach.
- B. It was requested that the Corps identify the impacts of constructing all of the flood control reservoirs identified in "Pick-Sloan" plan. Further, a similar maximization of flood control reservoirs on the Upper Mississippi River should be a integral part of the Corps systemic Flood Plain Management Assessment inorder to have the data necessary to consider the best way for controlling floods and reducing future flood damages.

DAVE RAHUBKA FPMA

cc: Dave Loss, Gary Nelson CELMS FPMA team CELMS-PD-F 15 Nov 94

MEMORANDUM FOR RECORD

TO: CELMS-PD-F FILES

SUBJECT: Public Meeting results, 15 Nov 94 19:00-21:00 hours, St. Louis, Missouri.

1. Subject public meeting was attended by 26 citizens. Considerable interest was expressed in the technique the Corps intends to utilize in presenting the Flood Plain Management Assessment (FPMA) data and analysis.

- 2. The Corps presentation went quickly (about 35 minutes) and a lively and worthwhile exchange of questions and answers ensued. The citizens attending were sufficiently interested in the ongoing discussion to stay for about 1/2 hour beyond the 9PM closing time.
- 3. In summary, one specific suggestion for improving the FPMA approach was heard more that once at this public input session as follows:

A couple of individuals insisted that the systemic Corps FPMA effort would be sorely incomplete if the worth and impacts of adding significant additional flood control (multi-purpose) reservoirs throughout the seven State study area were not evaluated. On the Missouri River system, it was requested that the Corps identify the impacts of constructing all of the flood control reservoirs identified in "Pick-Sloan" plan. A similar consideration for the Upper Mississippi River should be a integral part of the Corps systemic Flood Plain Management Assessment flood control and flood damages mitigation effort.

It was requested that the Corps FPMA accomplish a comprehensive assessment of all the known and proven ways/means for significantly reducing flood heights and damages. It was stated that major flood control reservoirs have clearly demonstrated that they are effective in significantly reducing flood heights and flood damages. Therefore, the FPMA would not be properly accomplishing its assigned mission, if it did not evaluate the possibility of many additional major flood control reservoirs throughout the seven State study area. Reservoirs have clearly demonstrated that they preform the flood control function very effectively. Therefore, they must not be excluded as one comprehensive systemic alternative to controlling major future flood events similar to the 1993 flood disaster.

MEMORANDUM FOR RECORD

TO: CELMS-PD-F FILES

SUBJECT: Public Meeting results, 8 Nov 94, Waterloo, Illinois.

1. Subject public meeting was attended by 48 citizens. Considerable interest was expressed in the technique the Corps intends to utilize in presenting the Flood Plain Management Assessment (FPMA) data and analysis.

- 2. The Corps presentation went quickly (about 35 minutes) and a lively and worthwhile exchange of questions and answers ensued. The citizens attending were sufficiently interested in the ongoing discussion to stay for about an hour beyond the 9PM closing time.
- 3. In summary, two specific citizen suggestions for improving the FPMA approach were as follows:

A. It was requested that the Corps develop and discuss in its FPMA report, some technique for judging the impact on flood heights of mankind creating "hard surfaces" that reduce rainfall infiltration. The many shopping centers, roads, parking lots, and other urban and rural development has reduced the ability of rainfall to infiltrate. What is the overall significance of these activities by mankind upon small, medium and large flood events?

B. It was requested that the Corps develop and discuss in its FPMA report, some technique for better presenting and evaluating "human trauma" caused by large flood events. It is considered that significant short and long term human trauma damages are caused by large flood events that is not properly or clearly evaluated.

St. Paul District Summaries

SUMMARY OF PUBLIC MEETINGS

and other written comments

The following Public Meetings (Discussion Sessions) were held in November, 1994 at 13 locations:

DISTRICT/DATE	CITY, STATE	MEETING TIME	ATTENDANCE
ST.PAUL DISTRICT		·	
November 14	St. Paul, Minnesota	2:00 pm session only	14
November 15	LaCrosse, Wisconsin	2:00 pm session only	15
ROCK ISLAND DIST			
November 21	Burlington, Iowa	2:00 and 7:00 pm	0, 37
November 22	Quincy, Illinois	2:00 and 7:00 pm	3, 125
November 29	Moline, Illinois	2:00 and 7:00 pm	2, 63
OMAHA DISTRICT			
November 14	Nebraska City, Nebr.	2:00 and 7:00 pm	20, 35
November 15	Sioux Falls, S. Dakota	2:00 and 7:00 pm	3, 0
KANSAS CITY DIST			
November 9	Topeka, Kansas	2:00 and 7:00 pm	5, 8
November 10	Kansas City, Missouri	2:00 and 7:00 pm	2, 30
November 16	JeffersonCity, Missouri	2:00 and 7:00 pm	10, 25
ST.LOUIS DISTRICT			
		7.00	40
November 9	Waterloo, Illinois	7:00 pm session only	48
November 15	St. Louis, Missouri	2:00 and 7:00 pm	0, 30
November 17	Alton, Illinois	7:00 pm session only	0, 39

The meetings in all Districts followed the same basic format: a set of slides and script provided by the St. Paul District. The Rock Island District varied somewhat from this format.. They conducted a focus group meeting before the public meetings were held in order to clarify the format and style of the presentation and obtain good public input. A random sample of people who had attended the June meeting in Quincy provided their input to the focus group. The focus group suggested simplifying the presentation and obtaining input on the action alternatives of the matrix by way of a survey sheet.

WHAT WAS HEARD?

Many people that attended the public meetings voiced comments at the meeting or provided written comments about their concerns. Some meetings were dominated by one main issue while other meetings had a wide variety of discussion issues. Comments from the public meetings and other written correspondance from state/federal agencies and interest groups have been recorded on the attached matrix table. These comments are in the process of being coded to identify the main interest or desire of all interested parties. A more detailed accounting of these desires and interests will be discussed in the Floodplain Management Assessment Report.

The following discussion describes, in general terms, issues that were brought up during the public meetings at the locations listed in the above table.

ST. PAUL DISTRICT

The St. Paul District held two meetings in the afternoon, each followed by Navigation Study Public Meetings held in the evening. The issues brought up for discussion by the people present were very diverse. The issue that received the most attention were the impact categories on the evaluation matrix table. Impacts that were discussed included: the need to recognize impacts to developed areas behind levees, water quality should be an impact category, the need for a common measurement rather than a combination of dollars and acres, and that environmental enhancement measures are not measured directly. Some of the other issues of discussion included the need for: a definition of terms used in the study ("hazardous", "cost effective"); an urban protection analysis; a look at long term costs, upland runoff, and other flood events, not just the "93" flood; planning for 500 year frequency seems excessive; and the need for data on agricultural subsidies and incentives. Each meeting lasted at least 2 hours with a question and answer period following the presentation. Participants were encouraged to submit comments in writting within the next two weeks and interviews to the local television station and newspaper followed the LaCrosse meeting.

ROCK ISLAND DISTRICT

The Rock Island District held the three public meetings listed in the table above. A public meeting was not held in Des Moines, Iowa, in November because the public meetings held at that location in June, 1994 were not well attended. A majority of agricultural farm interests were present at two of the three meetings and they were mainly interested in raising the levees to provide better protection.

Attendance and primary interest at each meeting location follows:

Burlington: 37 people attended and 30 filled out survey sheets that identified their primary interest in this study. Out of the 30 surveyed 47% expressed an agricultural farming interest, followed by 23% as business/industrial interests, 13% as other interests, and 10% as local

government interest. The main topics of discussion focussed on (1) levees: the need for maintenance and improvement, their value to navigation, and 500 year levee protection; (2) the public's confidence level for this study because of its limitations; and (3) economic factors and B/C ratios. A variety of other issues that surfaced included: flood insurance, water levels, water transportation, low cost housing outside of the floodplain, the need to evaluate other scenarios and the need for more data on recreational use and floodplain values before the 1993 flood.

Quincy: 128 people attended and 101 filled out survey sheets indicating that 70% represented agricultural farming interests and a very low representation in the other six interest groups. Most of the public identified overwhelmingly the desire to raise the levees to the 500 year level and suggested using dredged material. Many questioned the study itself as being too vague and abstract and hope that the April meetings will respond directly to what is in the report. Other issues that surfaced included identifying the individual characteristics of the floodplain, land use changes in the floodplain, floodproofing, relocation, not limiting flood fighting, consistency in government regulations, and water transportation. One creative thinker suggested betting on the water levels to provide a pool of funds.

Moline: 65 people attended and 50 filled out survey sheets identifying 38% in the Other categories (many were students from a water resources class and educators), 18% as urban homeowner interests, 14% as environmental interests, and 10% as agricultural farm interests. Because of the diversity of the audience 25 different issues surfaced and most of those consisted of only one comment per issue. Issues that surfaced that were different from those listed at other meetings were to utilize the natural river system, leaving 60 feet as a buffer, and removing structures from the floodplain, having State managed wildlife impoundments, protecting historical sites, utilizing the buyout, lower road profiles so flood waters can overtop, the need for a system-wide floodplain management for different areas (urban, wetland, ag., conservation, etc.), need for a total watershed basin study, lost flood storage from former tallgrass prairies now in cropland, and the poor survey.

The primary concern at the above meetings was on how the scenarios and matrix would be presented at the next set of public meetings. The public wanted assurance that the data would be available and that information should be furnished prior to the next set of public meetings so that they would have ample review time. The public who attended the meetings and viewed the three scenarios presented, felt that these scenarios did not meet the needs of the flood plain residents. A "do nothing" scenario was unacceptable to many people. The "moderate" scenario was perceived by many as only a follow-up to the Galloway Report and to meet the desires of the UMRBA and the Association of Flood Plain managers. The third scenario seemed totally unacceptable to most of the flood plain residents.

OMAHA DISTRICT

The Omaha District held two meetings and the primary issue of concern involved levees: enforcement of maintenance, set-back far enough to allow room between river and floodplain, flooding behind, and siltation on the riverside. Other issues that were discussed included:

adequate drainage, buffer zones, failed enforcement of zoning laws in the floodplain, and post-event insurance requirements equal for residents and agriculture.

An interesting observation from the Omaha meetings was that some farmers want to see private as well as federal levees set back to reduce water surface elevations and seepage problems.. It was also noted that after 2 to 5 feet of sand was removed the flooded land increased in fertility from the sediment deposits although enhanced fertility was sometimes overshadowed by weed growth in some locations.

KANSAS CITY DISTRICT

The Kansas City District held three meetings and primary interest involved agricultual levees left as they are, without raising because the raise may escalate flooding; along with protection of critical sites and relocations/setbacks for floodway. Other issues of concern included: Floodplain development, improved scenario descriptions, positive and negative comments on this study and the Missouri River Master Mannual, flood events, water supply, rights of the property owners, historical river context, and getting realistic agricultural data.

ST. LOUIS DISTRICT

The St. Louis District held three meetings and considerable interest was expressed in the technique that the Corps will be utilizing in presenting the Flood Plain Management Assessment data and analysis. In summary, the primary issues requested the Corps to: (1) develop a technique for judging the impact on flood heights of "hard surfaces" that reduce rainfall infiltration and the significance of these activities on flood events; (2) discuss and evaluate "human trauma" caused by large flood events; (3) develop a 4th scenario for a maximum structural flood control approach; (4) identify the impacts of constructing flood control reservoirs identified in the "Pick-Sloan" plan and on the Upper Mississippi River; (5) evaluate and add additional flood control (multi-purpose) reservoirs throughout the seven State study area; and to (6) accomplish a comprehensive assessment of all the known and proven ways for significantly reducing flood heights and damages.

CONCLUSION

It is expected that the April 1995 Public Meetings will clear up any misconceptions on the part of the public because the evaluation matrix framework will have the data needed to explain the impact categories and scenerios. The presentations will focus on findings and conclusions that will be contained in the draft assessment report, to be completed on March 31, 1995.

All comments received from the last round of public meetings, along with written comments received, during this timeframe, from state and federal agencies, and interest groups have been incorporated into the attached computerized matrix table. All comments are in the process of

being coded to identify the main interest or desire of all comments. A more detailed accounting of these desires and interests will be discussed in the Floodplain Management Assessment Report. A coded matrix table from each set of public meetings, along with written comments from state and federal agencies and interest groups will be included in Appendix D - Public Involvement, of the Floodplain Management Assessment Report.

A tenative listing for April Meetings at 7 pm follows:

DISTRICT/DATE	CITY, STATE
ST.PAUL DISTRICT	
Tues. April 18, 1995	St. Paul, Minnesota
Wed. April 19, 1995	LaCrosse, Wisconsin
ROCK ISLAND DIST	
Wed. April 19, 1995	Burlington, Iowa
Thurs. April 20, 1995	Quincy, Illinois
Tues. April 18, 1995	Moline, Illinois
OMAHA DISTRICT	
Wed. April 26, 1995	Nebraska City, Nebr.
KANSAS CITY DIST	
Tues. April 18, 1995	Kansas City, Missouri
Wed. April 19, 1995	JeffersonCity, Missouri
ST.LOUIS DISTRICT	
Wed. April 19, 1995	Waterloo, Illinois
Thurs. April 20, 1995	St. Charles, Missouri Combined mtg. with Kansas City District
Tues. April 18, 1995	Alton, Illinois

MEMORANDUM FOR RECORD

SUBJECT: Public Discussion Session for FPMA at LaCrosse, WI on 15 November 1994.

- 1. The subject meeting was held at the Holiday Inn at 2:00 pm. Attendance included those on the sign-in sheet (encl. 1), plus representatives of the the local television station and newspaper and representatives from the Navigation Study team (who conducted a public meeting at the same location at 7:00 in the evening). Those present from the FPMA team were: Dave Loss, Terry Birkenstock, Scott Jutila, Karen Nagengast and Ken Gardner. See other attachments for the similar meeting that was held in South St. Paul on 14 November.
- 2. Some of the the key comments included the following:
- For economic impact evaluation of ag levee alternatives are we going to recognize impacts to developed areas behind those levees? (Jonathan Ela and Bill Redding Sierra Club)
- The watershed analysis is of great interest and we must be careful to not misrepresent results by concentrating only on the 1993 flood and only on a portion of the basin. Also, the 5 and 10% runoff reductions appear to be on the low side. (Sierra Club)
- Traffic corridors should be included in the analysis of urban protection (Sierra Club)
- The "Galloway" Report did not adequately cover the area of agricultural subsidies and incentives. (Sierra Club)
- We should discuss how the runoff is reduced by upland measures. (John Flynn attorney)
- It would be preferrable to look at the long term costs of levees not just at a single point in time since they are subject to repeated repairs. (Sierra Club)
- In response to a question on how many of the pre-1993 ag levees have been restored we guessed at a figure of 50 70%.
- In response to a question of what will happen to our report after it is completed and how will its conclusions be addressed in relationship to the "Galloway" Report, we indicated that our report will be submitted to our headquarters office and Washington and be forwarded to Congress.

- The use of proposed reservoirs in the 1971 comprehensive basin study report as a basis for the additional reservoirs alternative is inviting criticism. (Sierra Club)
- Jonathan Ela (Sierra Club) requested a copy of the main report of the Corps 1993 post flood report. (request passed on to NCR for action)
- 3. The meeting lasted about 2 hours. Participants were encouraged to submit comments within the next 2 weeks. I provided interviews to the local television station and newspaper following the meeting.

DAVID LOSS, P.E. FPMA Assessment Manager

17 November 1994

NCSPE-M

MEMORANDUM FOR RECORD

SUBJECT: Public Discussion Session for FPMA at South St. Paul, MN on 14 November 1994.

- 1. The subject meeting was held at the Drover's Holiday Inn at 2:00 pm. Attendance included those on the sign-in sheet (encl. 1), plus a representative of the Minneapolis Star Tribune, and representatives from the Navigation Study team (who conducted a public meeting at the same location at 7:00 in the evening). Those present from the FPMA team were: Dave Loss, Curt Meeder, Terry Birkenstock, Scott Jutila, and Karen Nagengast. Other attachments include the handout (encl. 2), the slide presentation (encl. 3), the initial letter sent to the primary mailing list (encl. 4), the news release (encl. 5), and the reminder notice sent on November 3rd (encl. 6).
- 2. Some of the the key comments included the following:
- The definition of the term "cost effective" should be clarified since we are not intending to do a BCR analysis or annualize costs. (Harlan Hirte EPA)
- By measuring impacts with a combination of dollars, acres, etc., it will be difficult to reach a conclusion. The approach is like mixing apples and oranges and there should be attempts to quantify to the extent possible with a common measurement, such as dollars. (Brett Smith Sierra Club and Rick McMouagle Friends of the Mississippi River).
- Water quality should be an impact category. (Sierra Club).
- The watershed analysis may be misleading since it is only looking at the 1993 flood and is not utilizing the portion of the study area that has lost most of its wetlands Iowa and Missouri. Also, the 5 and 10% runoff reductions seem very low. (Sierra Club).
- The category of critical facilities that was labeled as "hazardous" may be misleading. It would be better to refer to this primary list of critical facilities as "health risk" facilities. (EPA and Sierra Club)
- Planning for the 500-year frequency event seems excessive. (Arnold Vogel Isaac Walton League).
- For claiming that Scenario 3 is the most environmentally based combination of policies and programs, we do not specifically address environmental enhancement measures very

directly, other than imply that they are a secondary result of other actions. (Sierra Club)

- 3. The meeting lasted about 2 1/2 hours. The Sierra Club left a letter of comment on the Milestone 2 (encl. 7) package and participants were encouraged to submit comments within the next 2 weeks.
- 7 Encl.

DAVID LOSS, P.E. FPMA Assessment Manager

SUMMARY OF OPEN HOUSES

The following Open Houses were held in June 1994 with the indicated attendances:

		Attend.
St. Paul, MN	June 13	20
LaCrosse, WI	June 14	35
∨Moline, IL	June 15	85
— Des Moines, IL	June 16	35
√Alton, IL	June 21	30
\checkmark Burlington, IA	June 22	85
√Waterloo, IL	June 22	30
/Quincy, IL	June 23	125
- St. Peters, MO	June 27	40
$\sqrt{\text{Jefferson City, MO}}$	June 28	75
$\sqrt{\mathtt{Kansas}}$ City, MO	June 29	100
- Topeka, KS	June 30	30
, -		

There are also 4 public meetings being held in the St. Louis area as part of the St. Louis Region Study and further input is expected from these meetings to provide guidance for the FPMA effort. They are:

Chesterfied Valley area	Sept.	12
Arnold, Fenton, and Kimmiswick area	Sept.	13
Areas of the St. Louis County and City	•	
of St. Louis flooded by the River Des Peres	Sept.	1 =
Crystal City, Festus, Herculaneum,	sept.	15
and St. Genevieve	Sept.	20

WHAT WAS HEARD? Approximately 10 percent of the individuals attending the open-houses provided written comments. These seventy-eight people represented diverse interests including agriculture, environmental, state government, county government, city government, private property, navigation and other industrial interests. Their comments have been recorded on the attached matrix.

A content analysis of these comments reveals four underlying themes. First, there is strong support among agricultural interests for improving and continued development of structural flood control measures, especially levees. Second, the environmental interests together with some agricultural and recreational interests tend to support the idea that greater emphasis needs to be placed on non-structural measures, particularly those that will provide environmental enhancements and benefits. Comments also focused on perceived contradictions and blurs in floodplain management policies. Here, agricultural and environmental interests together with local and state

government representatives called for greater coordination among agencies responsible for managing the Upper Mississippi and Lower Missouri rivers. The fourth theme suggests that there was a genuine interest or quest for understanding and explaining the flood of 1993.

Other comments focused on specific problem areas and often delineated detailed solutions. These comments have been shared with appropriate Corps district personnel.

modelly you offered opportunities for input, our ability to participate was limited due to funding constraints and the fact that agencies other than the Corps of Engineers were not full partners in decisions. Therefore, these comments are the result of a minimal review and should not be construed as being comprehensive nor the limit of our concerns.

Congress or committee. We do not fault the Corps for that, in fact, we feel the request could not have agencies to fully manage the Upper Mississippi River "System" is not yet available. This report does, 'partnership" approach, the management options can be determined for the future of this major river been met with the time frame and resources provided. It might be useful for the report to indicate what would yet have to be done to meet the Congressional requests, so Congress does not labor under a mid-impression. The data information and analysis necessary for local, state and federal While the report provides some useful information, it does not appear to fulfill the request of the however, provide a good start in that direction, and with adequate time, resources and a basin in the nation.

has very limited "assessment" of state floodplain management programs. The discussion seems to inconsistent where a given state has developed its own program to go beyond the minimum federal development for state or local agencies in management of floodplains throughout the basin. It also provide some useful information to FEMA for some of its efforts in the future. Since it has a major used in different states and communities to determine which is most effective and efficient, so that strength, not a weakness. The disappointment is the lack of analysis of the different approaches focus on the "inconsistency" of state programs, as if that is a negative thing. State programs are information could be used as a basis of improving the ability of states and locals to reduce flood focus on flood control and on the main stem, it would appear to have limited use at this point of This report should be useful as a basis for future study by the Corps in its programs, and may program to address flood concerns and better prevent flood damages in that state. That is a losses and to reduce the costs of flooding to federal, state and local governments. The document provided a good history of attempts to structurally modify the flow characteristics of the addition, the report identifies a major concern associated with levee construction in that levees induce Upper and Middle Mississippi River basin. The report analyzes ways to protect existing development suggested land use planning as an effective alternative to structural modification for reducing flood while still recognizing that when levees are constructed the flood risk is not entirely eliminated. In increased development behind them. It also acknowledged that, as early as 1936, Gilbert White damages.

A major limitation of the report is that it focused entirely on the floods of 1993 and did not relate to the standards in place - especially protection of most development to the 100 year flood elevations. The floods of 1993 were unique, like all floods - they will never reoccur to exactly the same height or areal extent throughout the basin. This limitation was most obvious in the portions of the report related to

* were flood elevations above the 100 year flood protection elevations because of outdated hydrology? portion of the damages occurred in areas outside the 100 year floodplain (the area at which state and * were areas behind levees not mapped as floodplain even though the levee did not meet standards? could then be explored. In addition, this information would be useful in another portion of the report in * were increased flood elevations caused by dam failures where the mapping did not include that as impact of state and local floodplain management and zoning practices by indicating that a significant On page 1-8, the report states "the locks were ready for operation before USCG had determined the that is often overlooked. Although the locks may have been ready, the navigation channel (adequate state and local floodplain management and zoning practices. The report appeared to downplay the depths) and navigation aids (gone or destroyed) were not. The USCG acted prematurely to opening the channel to commercial navigation before the system was safely ready to handle it. This resulted areas flooded were above 500 year elevation. In Wisconsin, only two very isolated areas had flood river to be safe for traffic". This statement seems to ignore a major aspect of the navigation system in numerous groundings and increased risk of accidents and spills. Further, the rush to dredge after these groundings resulted in "emergency dredging operations" and increased problems associated and 10-29. The report should include some description of the extent that this was the case and an should be compared instead of just number of structures damaged. Various management options local floodplain management programs are focused). The report mentions this on pp. 8-4, 10-24, areas outside the floodplain were substantially less than areas in the floodplain or in areas flooded was above 100 year and also where it was above 500 year elevations. The report implies that all In addition, the report needs to acknowledge that the depth of flooding and therefore damages in assessment of why this occurred. The report should include a map that identifies where flooding which it is identified that the damages to structures when a levee fails tend to be more severe. due to levee failure. Total damages in the following types of flooded areas: elevations that exceeded 100 year flood elevation. Some scenarios that should be evaluated include: were areas mapped incorrectly? accept it for mapping flood hazard areas and using those maps for floodplain management. It will

This study made progress on developing an unsteady state computer model for large river systems.

Such a model is needed. Before the modeling done in this study can be used, the work needs

also be necessary that some agency agree to be responsible for completing and maintaining such a modet, just as all acceptable national computer models are handled now. Perhaps the Corps is a

COMMENT OR QUESTION logical agency to do that. CODE FROM

On page 10-24, the third paragraph discusses the "risk based" design approaches to structural flood protection projects presently being proposed by the US Army Corps of Engineers. A more detailed explanation of "risk based" design should be included. Considering the catastrophic damages that more detail. How would levee heights have been impacted by a "risk based" design criteria? The occurred due to the floods of 1993, the report should discuss the "risk based" design proposal in summary and findings should include a discussion on "risk based" design.

in relation to implementation of "risk based" design. The statement that the number one lesson from significance of "risk based" design and especially since it is something that is primarily under the US Army Corps of Engineers control, the conclusions in this paragraph should be specifically discussed unacceptable would seem to contradict the concept of basing levee design height on the amount of the 1993 flood was that large amounts of damage associated with extraordinary flood events are In the last paragraph of the summary on page 10-31, appears to be a summary of the summary. development (that is discussed earlier in this section) behind levees that will increase the risk of structures protected. In addition, "risk based" design does not take into account the induced This paragraph should be expanded and highlighted so that it is easier to read. Due to the flood damages over time.

discussion focused on legislative changes that have occurred since the floods of 1993. Since there were none, very little discussion was included. Additional discussion should have been included regarding the willingness of local government to enforce floodplain regulations already in place. Additional scenarios associated with increased federal monetary support of state floodplain policies/programs) were selected. For example, in the section of state/local programs, the In the evaluation portion of the report, it was unclear how the scenarios (changes in management programs should have been included.

governments to use in developing their floodplain management regulations." What "products" are Improved mapping for local government should be included as an effort of value on page 12-5. being referred to? The product most needed in Wisconsin, is large scale floodplain mapping. On page 8-4, the report states "All the states could benefit from readable products for local scenario in which such mapping is provided to local government should have been included mentioned this specifically at one of the public input sessions.

floodplain" is followed by the sentence "Many of the structures in these communities are, therefore, In item 1 on page 8-4, the sentence "a large portion of the damages were to structures outside the nonconforming or historically significant." It is unclear as to how these two sentences are related. We recognize that the document had several authors which can inhibit the "flow" of the document. As a result, we found the document difficult to read. We suggest that the "scenario" descriptions and the alternates and the evaluation of action alternatives. We found the matrices developed difficult to evaluations of "scenario measures" should follow each other - likewise for description of action

interpret and feel they could easily be taken out of context. For instance it is unclear why state floodplain management and zoning went from a low to high associated with scenarios 1 and 2 respectively. More narrative regarding the matrices and clearer indices identifying the abbreviations used would be helpful.	Scenario III on page 8-6, suggests that state governments as well as federal agencies be required to meet the standards in Executive Order 11988. Wisconsin already has such a requirement - via an executive order issue by the Governor of the State of Wisconsin.	We believe the discussion on wetland restoration is misleading. On page 12-2, the report indicates that modeling showed that reducing runoff from upland watersheds by 5 and 10 percent would have lowered the flood stages by 0.6 and 1.3 feet respectively. The report then states that wetland restoration measures would not have achieved this level of reduction for the 1993 event due to extremely wet antecedent conditions. The first paragraph on page 12-3 states that depressional areas are normally already full of water during a major flood event. The conditions existing during major flood events vary substantially. A statement that depressional areas are normally full needs justification and supporting documentation. The report should include a discussion of the impacts for the entire range of events - from annual to the flood of 1993. We suggest the following statement: "The Flood of 1993 was an extreme event and it is questionable whether increased wetland storage would have reduced flood stages since a prolonged period of rainfall in the fall of 1992 and the spring of 1993 filled much of the flood storage areas. Increased storage would have more impact on more typical and/or more frequent flood events."	As indicated earlier, it was good to see a recognition of catastrophic damages and induced development that occur behind levees. Other costs discussed in the report appear to lack foundation. An example seems to be the costs identified for raising the levees, where we were unable to find supporting data. The report does not have information on comparing the economics of the various approaches, which would seem necessary before they could be used.	It is not clear who the Corps thinks will use the report. If key decision makers in Congress and the Administration are the audience, some modifications in the way the findings and recommendations are presented will be necessary. The document is too detailed for that audience. Perhaps a bridge document, which talks in different terms, would be useful for such an audience. The Corps could work that up separately, and continue to use this report as background and as a starting point for further "partnership" study efforts to determining future management options.	This document is without a doubt one of the better documents the Corps has ever written in terms of evaluating a wide range of policy options for dealing with flooding problems. The analysis task was massive, the findings are thought-provoking. The conclusions are wide ranging and go far beyond COE traditional authorities. It is our hope that the Clinton Administration and the Congress use this document in conjunction with the Galloway Report to make some serious changes in flood control and river management policies in this country.

COMMENT OR QUESTION Specific Comments CODE 9

Executive Summary - This seems pretty weak given all of the material in the findings and conclusions in the main text of the report.

P. 8-13

Federal Costs could have been reduced by limiting cost-share to 75%, but the odds are that a lot of the acquisition/relocation projects that have been or will be completed would not be accomplished.

P. 8-13, paragraph 4

but they had no funding and no specific program for joint funding to accomplish wetland restoration at River Flood, the F&WS was adamant that wetland restoration had to be included in the IHMT Report, the time. If recommendations about mitigation are going to be made and approved, then a realistic identifying specific implementable projects complete with funding. As an example in the 1989 Red IHMT Reports have had a tendency to take a "shotgun" approach to flood damages rather than program for implementation and funding for implementation must also be included.

P. 8-27, paragraph 5

Why should farmers get subsidized rates for Crop Insurance? For that matter, why should floodplain taxpayers that make wise decisions about where they live be penalized because others do not! The residents in pre-FIRM homes get subsidized insurance? Subsidies are fine while new programs are being initiated, but over a period of a few years these should become actuarially rated. Why should subsidized. As far as cropland is concerned, there is an assumption that floodplain land should cost NFIP flood insurance program has been around for 25 years and many, if not most, rates are still less because of the flood risk, and this difference in cost should help to offset the cost of disaster insurance. Agriculture is an acceptable and even encouraged use of floodplain areas in many cases, but there are risks involved and society at large should not have to pay for these risks.

P. 8-29, paragraph 2

floodway. Unfortunately most rural areas in the country do have designated floodways from FEMA, construction begins. A final problem is that many agricultural levees are built in pieces and there is No new levees or repairs of badly damaged levees should be allowed riverward of the edge of the little effort to plan for or model a consistent level of protection from the head of a watershed to the and few states or communities require levee developers to designate a floodway before levee

P. 8-29, paragraph 4

Municipalities, counties and sometimes townships are primarily responsible for administrating floodway regulations.

P. 8-29, last paragraph

Why have private or local levees been allowed to decrease the level of protection of federal levees without providing compensation or improvements to the federal levees? In Minnesota, a huge fear

certified levee and thereby recreate the need for flood insurance and regulations in areas that have is that floodway encroachments could cause a reduction in the level of protection provided by a COMMENT OR QUESTION CODE FROM

been provided high levels of flood protection.

8-34

- * National Flood Insurance "voluntarily participated" may be an overstatement. "Coerced to participate" may be more realistic.
 - * Are there any positive inducements rather than penalties that could be used to encourage communities to participate in the NFIP?
- * As soon as disaster assistance of flood insurance payments are made for a property, the property should automatically be mapped as a floodplain. GIS and GPS capabilities should make this quite possible.
- because they are paid off or because the property was purchased under a contract for deed or with private financing. Some way needs to be found to require insurance for non-mortgaged properties. * There are still too many properties that should have flood insurance that do not have mortgages Of course, avoidance of floodplain areas in the first place is the best solution for most homes, businesses, and land use.

P. 8-37, 8-hh

Anything we do costs money. What criteria do the authors suggest for evaluating these programs?

P. 9-32, paragraph 2

wetland restoration very desirable. Maybe COE, FEMA, EPA, SCS and F&WS should develop a joint oversold. 2.5 million acres of wetland restoration at a cost of approximately \$1000 per acre for 1 foot It is good to see a reasonable approach taken to the flood control benefits of wetland restoration on a somewhat larger watersheds. There are also a lot of other good reasons to restore wetlands, but the watersheds. There may be good benefits from wetland restoration for smaller storms or floods for restore and protect wetlands and that these in combination with flood control benefits may make however, that you emphasize that there are many good non-flood control reasons to continue to of flood stage reduction seems excessive just for the purposes of flood control. It was noted, benefits of wetland restoration for large floods, over large watersheds, have in the past been program for wetland restoration rather than individual programs emphasizing single benefits. large basin scale. There may be large flood control benefits for wetland restoration in small

P. 9-42, paragraph 3

levees have usually been thought of as providing 10-25 year flood protection! What is an appropriate Since when is 50 year flood protection with 3 feet of freeboard a "relatively low level of protection for level of protection for urban and rural areas? We cannot always construct flood control projects for agricultural land"? There are communities all over the country that could really use this level of protection even if flood insurance and regulations were still required. In Minnesota, agricultural the worst case scenario.

CODE COMMENT OR QUESTION

flood control? What ever happened to ecosystem management, recreation, aesthetics, etc.? It is no wonder that the Upper Mississippi River states are leery of the Galloway Report recommendation for Since when are the only components of an integrated comprehensive river system navigation and a Lower Mississippi River System model for interstate coordination, planning and implementation.

P. 10-3, paragraph 2

If levees are the selected alternative for flood protection, a system of 50 year protection for agriculture and 500 year protection for developed areas seems to make good sense. At least it is a planned system. There are, however, the looming questions of residual risk and induced development behind levees.

P. 10-5, last paragraph

In theory, a good system-wide flood control system should start at the top of the watershed and work down in order to insure some sort of consistent level of protection. The fact that the flood protection system for the lower Mississippi is already in place, puts potentially severe constraints on what can be done on the Missouri, Middle and Upper Mississippi Rivers.

P. 10-6, paragraph 1

The Middle Mississippi River may not be "stable" in an engineering sense, but may be trying to establish stability in a geomorphological sense and possibly in an ecological sense.

. 10-15

above the 100 year flood elevation. The .1 foot of flood stage increase due to floodway obstructions is not familiar. FEMA does allow homes and businesses to be built in the floodway as long as they are businesses to be constructed in floodway areas. There are many improvements still needed in state FEMA allows floodway encroachments that cause up to 1 foot of stage increase in the process of designating a regulatory floodway. There is no FEMA requirement that homes be elevated 1 foot elevated and do not cause a stage increase. It does not make any sense to allow homes and and national floodplain management programs.

10-16

Minnesota does not require "state permits" for floodway or floodplain development. These are administered locally based on minimum state standards.

P. 10-18, 10-K 10-I

have been notified that they need to participate because of the presence of mapped floodplain areas Any community is eligible to participate in the NFIP. You are probably referring to communities that within the community.

P. 10-19, 10-U

This is essential for a meaningful and timely response to disasters. Adopting uniform application forms and environmental review procedures would be a huge first step.

people know it, FEMA should most like map it and set rates accordingly. But then FEMA has not for a It is our understanding that the Donnelly data has been largely discredited. Minnesota does not have efforts of the EMP to open up and restore backwater areas in the pools of the Upper Mississippi River many projects would have been built since 1968 if these requirements would not have been removed. floodplain areas. People in these areas would not buy insurance if there was not a known risk. If the In conclusion the Corps of Engineers is to be commended for producing a truly outstanding review of * We greatly appreciate the honest appraisal of some of the shortcomings of structural flood control structures in the floodplain subject to flooding. This number has probably been reduced by 3000 to floodplain zoning and flood insurance requirements once the project is completed. It is unlikely that It is very important to stress that no matter what level of protection is provided by whatever means, The discussion of sedimentation is very interesting and informative but does not seem to fit with the number of years been aggressively pursuing improved mapping. There appears to be much more interest in selling insurance policies than in providing good floodplain management information to This letter provides our comments on the March, 1995 draft "Floodplain Management Assessment" extremely expensive. The model has some very interesting capabilities, but our experience on the There are a lot of areas with known flooding problems that have not been officially designated as the benefits and detriments of past and present flood control policies and laying out some old and some new directions for the flood control policies of the future. This is one of the more extensive analyses of structural and non-structural flood control measures ever to have been written by the It should also be mentioned that refinement and extension of the UNET model could be (will be) * For many years one of the attractions of COE flood control projects has been the removal of 98,000 floodplain structures. Estimates made in the 1970's indicated approximately 17,000 4000 structures due to acquisition/relocation and federal/state/local flood control projects. Red River is that you need to have a huge budget to develop and use the model. projects that have been a mainstay off the COE for many years. that have been cut-off or filled in with sediment. A discussion of flood risk would also be of benefit to most readers. The 1993 flood was an extreme event, which the report acknowledges, but little additional information is presented as to how extreme the event was. Discussing management and the level of risk that is considered acceptable for structural flood control projects of the level of risk reduction the government should provide. Policy decisions on future management should not be made solely on the basis of the 1993 flood and a full understanding of the entire risk spectrum is needed to make intelligent decisions. Some more detailed issues noted in our review are as follows: It would also be useful for the Corps to complete an inventory of critical facilities in the study area, since they would logically be included in future studies. In the discussion of flood fighting, it would be worthwhile to recognize the difficulty of limiting actions as suggested in Chapter 9 without strong prior agreements at the highest level. On page 941, leves with overflow weirs are discussed with the need to have prior understandings with landowners. It would appear logical to discuss whether some form of compensation or easement might be appropriate. While the conclusions talk about the effectiveness of storage reservoirs in the mix of detention measures, it is worthwhile to note that the analysis of the effectiveness of other possible reservoirs is not that promising. On page 10-15, it is stated that the FEMA model ordinance restricts development to uses that will not create more than 0.1 ft. of rise and requires that structures be elevated or floodproofed to at least one fore above the 100 year elevations and only require structures to be elevated or floodproofed to the 100 year elevation.	This report is a very valuable historical tool and is interesting in its limited scope. 5/5/95 Unfortunately, there is no identification of management strategies and their impact on the river transportation industry. Certainly the river vessel owners were impacted. Some towboat industry estimates claimed revenue losses of \$1.5 million per day. The dislocation of barge and towboat equipment took several months to correct after flood waters receded, causing further financial damage to the vessel owners and users. The river channel seemed to have a mind of its own for months after the flood waters receded causing delays for towboats and barges while waiting for COE dredges to clear the obstructions. US Coast Guard established regulations for towboat operators that created smaller less efficient tows until the flood waters receded. Loading facilities along the river were shut down and damaged along with commodities in storage. This impact was felt by producers, shippers, and receivers in domestic and international trade. This also affected employees of towboats and river terminals. Numerous shipments intended for river transit were either held or rerouted at substantial additional cost. Other modes such as rail and truck were unable to meet the shippers demands due to flooded roads or rails. The Flood of 1993 had a drastic impact on commercial navigation and users of the waterway navigation industry. This transportation impact development and control of river structures and operating policies.
EROM	US Dept. of Transportation Great Lakes Region Des Plaines, IL

In addition, your assessment should look at a broader picture of intermodal land transportation and owners such as Sea-Land, American President Lines, Matson, etc. to determine if their container cargo crossing the Mississippi River Basin was affected by the flood. We found some serious cargo crossing the Mississippi River Basin was affected by the flood. We found some serious circuitous routes in order to continue the flow of commerce. Maritime container cargo to Hawaii and In other cases, container movements were disrupted due to the rerouting that caused manufacturing railroad bridges and right-of-ways along with highways were closed due to the high water during the flood. Your assessment includes recreation, agriculture, airports, power plants, water treatment facilities, in your struck deat.	The draft Floodplain Management Assessment (FPMA) Report, which you provided on March 31, Meeting regarding the Report and the reports on the comments received during the round of public Meeting regarding the Report and the reports on the comments received during the round of public Meeting regarding the Report and the reports on the comments received during the round of public have been made from the draft document I provided prior to the meeting. As an overall summany, it is noted that although the authorizing language directed the Corps of Engineers to analyze flood control measures and floodplain management needs, the title chosen be managed to preclude a recurrence of the 1993 disaster as well as being restored to an enaloged to preclude a recurrence of the 1993 disaster as well as being restored to an addresses how the flood events can be controlled. As was discussed at the Team meeting, there are three major concerns that the Corps must address as the document is presented to those who may rely on the conclusions as follow-up event, while decisions should be based on the cumulative results of analyzing the entire range of avoided because of the failure of agricultural laves despite flood flooding events. Secondly, the Report clearly identifies that major damages in urbanized areas were is essential that a forecasting model be refined so that the appropriate degree of protection to management concept. The last point is that while the Report supports the concept that restored inhibit conveyance) the real value of wetland must be assessed in terms of damage control and environmental integrity of the floodplain. By looking at only the one event, this Report does not
CROM	Section Chicago, IL

COMMENT OR QUESTION authoritative reference document regarding this aspect of floodplain management. While your staff is to be commended for preparing the report on a tight schedule, it is unfortunate that	even with this schedule, many decisions have already been made to repair levees to the point where most of the alternatives considered are unrealistic.		At the meeting the Corps was making absurd claims. The Corps indicated that wetlands did not impact the flood of 1993 since they were all full of water. I asked for clarification and pointed out that over 80% of the wetlands in the watershed of the area that flooded had been destroyed. I also pointed to the Illinois Water Survey Study that found a direct relationship between the loss of wetlands and increased flood heights. The Corps explained that the loss of these wetlands had no impact on the flood since the remaining wetlands were all full.	I persisted and asked for more clarification. (The Corps had been describing wetlands as sponges.) I said if 100 years ago you had 100 sponges that could each 1 gallon of water and you poured 100 gallons of water on them the sponges would hold the water. If today you only had 20 sponges left and your poured 100 gallons of water on them you would have one hell of a mess. But the Corps explained I just did not understand. It did not matter since all the wetlands were full of water. I then explained that if there used to be a wetland where the hotel we were in is, the wetland would have provided flood storage. I pointed out with the gutters and storm water drains, the hotel no longer provides flood storage, it all drains away. The Corps told me I was wrong. They said a hotel provides just as much flood storage as a wetland does!	This demonstrates the people doing this study are incompetent. May we suggest that the St. Louis District people be directed to leave their computer models and go outside their building and watch what happens the next time it rains.	The report also makes erroneous claims about the importance and impact of wetlands on flooding. The report incorrectly concludes: Restoration of such wetlands would not have impacted flooding in the lower floodplain reaches because most depressional areas were already full of water throughout the watershed, as normally occurs during flood events. Assessment at 6-28 The draft assessment contradicts this claim by stating: Also, the extremely wet, cool, conditions had drastically inhibited spring planting in some areas,
CODE		5/10/95				
(D) FROM		6 Sierra Club Piasa Palisades Group East Alton, IL				

COMMENT OR QUESTION resulting in little vegetation in the fields of this heavily farmed region. This further exacerbated the flood conditions as it reduced soil moisture hold capacity and left little vegetation for evapotranspiration. Assessment at 6-8 Wetlands do not need to be planted. If the wetlands had not been drained and converted to farm fields, they would have held much more water and would have provided evapotranspiration. Thus, the conclusion is in error.	On page 6-16, the Assessment contends that wetland restoration would not have an impact. This is based on the premise that all the depressed areas were full of water in the Flood of 1993. The Corps seems to have forgotten what happens when a wetland is filled and destroyed. When a wetland is filled in to build a shopping center, house, or road, the ground is filled in. There is no longer a depressional area to store water. It does not take a rocket scientist to figure out that the water that used to be in the wetland has to go somewhere else, which means higher flood levels. The Corps wants us to believe that when a wetland is filled in the water that the wetland used to store magically disappears.	In summary, the Corps claims about the influence of wetlands on flood heights are simply not true. Please include correct information in the final assessment.	I have read your Public Notice, dated April 3, 1995, announcing PUBLIC MEETINGS REGARDING THE FLOODPLAIN MANAGEMENT ASSESSMENT ON THE UPPER MISSISSIPPI AND THE LOWER MISSOURI RIVERS, the Executive Summary and Chapter 12 - Conclusions.	I am a civil engineer, having been in County Highway work for 38+ years. I have been responsible for bridge and culvert design, construction and maintenance for this time. In Illinois, we have used the USGS Regression equations and the Hydraulics of Bridge Waterways, USDOT, September 1970 and in later years WSPRO to determine the necessary waterway openings for our structures, and the backwater caused by our structures.	As a matter of interest, whenever we received a "design rainfall" amount in a waterfall, I checked the water elevation. I can verify your conclusions that the saturation of the soil and the "n" value, the roughness of the surface over which the flood flows are two very significant factors.	I further concur that the wetlands even if drained and farmed especially in the floodplain do not significantly impact the flood elevation, in fact if empty, they would serve as flood water storage areas at low flood stages. As far as the timbered floodplains, old growth timber with less understory growth would have a lower n value, hence faster flow, than say a corn field, at lower flood elevation. So, whether the land is farmed or in timber, really is rather immaterial as far as downstream flooding, it seems to me.	I further agree that floods are a natural occurrence. Levees are a good protection up to a certain stage flood, then above that (100 year, 500 year or whatever is justified) we just have to expect the floodplain.

COMMENT OR QUESTION	The fraudulent Floodplain Management Assessment! This has been a \$2,000,000 waste of taxpayers money because it is a fraud. How can this be called a Floodplain Management Assessment when there is no accounting for the billions of taxpayer dollars spent on so called flood control, levee building, reservoir building, etc., which were contributing causes to the great flood of 1993.	No mention of the thousands of acres of land taken out of production and flooded permanently, under the guise of protecting other land downstream from occasional flooding and the cost to the taxpayers of doing this.	How can an honest, accurate, intelligent assessment be made unless these figures are indexed into it? It can't be done, ask a CPA.	On pg. 12- "The assessment will focus on the floodplain of these river reaches, generally considered to be the 'bluff to bluff area. This is the correct description of the floodplain, but the beginning of the floodplain elevation must be identified at various reaches of the river, and all other figures, their so called 25-yr50yr-100yr-500yr-Standard Project Flood numbers, relating to any flooding must be indexed to it. The present use of these numbers are misleading, false and fraudulent since they don't index to the beginning of the floodplain and the floodplain. They don't relate to floodway, engineered and manufactured by the Corps of Engineers, not the floodplain and should be so stated.	Why aren't the total sums of tax dollars spent on each drainage district shown, so a true cost perspective can be shown. Example- South Quincy drainage district, Index the 1939-1954 expenditures: 1939 - \$61,200; 1954 - \$1,231,000; 1992 - \$10,500,000; 1995 - \$880,000. To inflation and today's costs and the Taxpayers have paid about \$5000 per acre for this district. This does not include yearly sums by Corps districts.	Show the same totals for all districts on the river.	Show the totals expended on these districts by the Corps, FEMA and Dept. of Agriculture relating to the flood of 1993.	Until and unless all of these expenditures are figured in this assessment it won't be truthful and realistic. No private business would tolerate such and incomplete, inaccurate assessment, why should we taxpayers?	Show how many businesses, industries and cities were flooded out due to raising agricultural levees. These damages should be indicated separately and those districts responsible for this illegal flooding of those businesses, have to compensate them.	Why wasn't the flood of 1851, in the Quincy area of the river, used as a reference point in it's relation to the 1993 flood? It's volume was about 35% greater at stage 22.7, while the manufactured flood
CODE	5/3/95

CODE COMMENT OR QUESTION stage of 32.3 in 1993 shows how raising levees caused considerably more damage to businesses and industries not in the floodplain. 9.5 feet lower stage with 35% greater volume - this shows	what a poor job the Corps has done with their so called flood control. Basic problem on the Upper Mississippi River, the Corps has built a 5 gallon bucket and are trying to put 10 to 15 gallons of water into it, this is physically and mechanically impossible.	This "floodplain management assessment" should not be done by the Corps of Engineers, since it's a conflict of interest, studying their own mistakes and engineering, what kind of an assessment can we expect. Don't depend on it.	The Great Flood of 1993	6/29/94 Engineered and Manufactured by the Corps of Engineers and Congress, paid for by the taxpayers.	Let's look at some of the statement or mis-statements made in the past months relative to the river and the 1993 flood.	Quincy Herald Whig Sun, March 6, 1994, John Robb has it all figured out for the taxpayers to pay for raising all levees from Minneapolis to Cairo eight feet, at a cost of 1.8 billion dollars.	He didn't mention how many more billions would be required to protect all the cities, businesses, industries and homes this would flood out.	He didn't mention how much the taxpayers have already spent on this gigantic pork barrel project.	Raising levees that much will require every city along the river to rebuild their sewage systems, their water plants and most other facilities near the river.	Who would be flooded out at Quincy? Gardener Denver, Celotex again, Quincy Water Works, Frese fron and Metal, Comstock Castle again, SSBC again, MSBC, Quincy Ready Mix, Duesterhaus Fertilizer, Quincy Boat Club again, Bayview Storage again, Quincy Sewage Plant, all other businesses and homes and camps along Front Street, Bay view drive and North Bottom Road.	All so called "flood walls", Canton and Hannibal locally, won't be high enough. Every city from Minneapolis to Cairo, IL would be flooded out.	This 1.8 billion cost just to protect dirt, which Mother Nature put there for an expansion valve for the river. The Corps has spent hundreds of millions of dollars on these through the years and results were 15 to 30 billion dollars in damages in the 1993 flood. Was this a good buy? For whom-Not the taxpayers.	If a private engineering firm would have designed and built this they'd have been sued for
ID			9 Allie J. Lymenstull Quincy. II.										

manufactured level of 32.2 in 1993. Nine and one half feet lower, and moving down river it's full width. Had levee been back one mile, river stage would have been approximately 23 feet, minor flooding of Have you heard of any one mention that the largest volume of water to go by Quincy was the flood of Had there been no levees on the river, with river free flowing, and only the "floodplain" to be flooded, Increasing capacity by moving levees back is the easiest and most practical way to prevent this type Of course Mother Nature could still throw us a curve and flood out everything. Remember our bluffs It's past time that the Government Agencies and their personnel be held accountable for these costly Approximately 50% of the bottom lands (floodplain) could be farmed as it is now and not have to be Building levees back approximately 1 mile on each side would provide enough running room for the don't want anyone to get flooded but this is going to have to be addressed with sound economics Agencies and Drainage Districts going to pay for flooding them out-don't hold breath waiting for it. manufactured flood of 1993, thousands of them. Is FEMA and the Corps and other Government Otherwise drainage districts should be required to carry liability insurance to compensate those river. This land could be farmed most years but would be subject to the river flooding-so cities, Two miles back approximately 20 feet stage, no flooding of industries or cities along the river. 1851, a volume approximately 35% greater than in 1993. The river stage was 22.7, not the How many innocent people and businesses, not in the floodplain, were flooded out in this incompetence and poor engineering. Where is the safety factor on this-there is none. Hull, Alexandria, Quincy and many other towns were not flooded out as in 1993. river stage would have been in the range of 17 ft to 18 ft. cities, factories and businesses they are flooding out. and proper engineering, with proper safety factors. mistakes and damages as a private firm would. businesses and industries are not flooded. flooding and provide proper safety factor. were once Coral Reefs in a large sea. some Quincy businesses along river. COMMENT OR QUESTION	This letter is in regards to the Floodplain Management Assessment Study.	This report was very helpful in many ways. Many falsehoods relied upon by the environmental community were proven untrue by the report. Vast wetlands would not have made any difference on the flood height.	Also no levees with natural vegetation would have produced similar flood heights. The area of the report that I have trouble with is the model of all levees surviving would cause a seven foot higher crest at St. Louis. This model cannot be correct and it needs to be reviewed and verified by the Mississippi Basin Model or by the flood flows of 1993. Thank you for all the work that was compiled in the more.	Please find enclosed, comments which were given to the St. Louis and Kansas City Districts during the public hearings. In addition, I will offer the following observations.	Many of the study findings are very helpful toward elimination of ideas that do not have any basis in fact, such as, "wetlands do not effect major floods."	However, the continued statement of the Corps which are entirely biased toward the environmental view, FMAS 9-14, "In areas where annual flooding is allowed to occur unhindered, the bottomland farm fields are rich and require little supplemental fertilization", are absolutely not true and only add to the animosity between Urban and Agricultural interest, which the environmental industry has carefully nurtured.	In the St. Peters meetings, Marvin Meyers of the Missouri River Bottoms, gave the exact analysis which he had conducted of silt and sediment deposited on his farm, by the 1993 flood. The analysis were very deficient and not suitable for modern agriculture.	Maybe the Corps environmental consultants are confused by the needs of another environmental dream, "sustainable agricultural," which produces yields of 50 years ago, 50 to 60 bushel corn, compared to the needs of modern agricultural, 150 to 200 bushel corn, and will bankrupt the farmer and starve America.	On my farm, in the Mississippi River bottoms, near Gladstone, Illinois, which flooded in 1993, I applied 400 pound per acre of potash to 300 acres of soybeans and wheats, in 1994. Will the facts, of Mr. Meyer's soil analysis and Mr. Robb's fertilizer application, be printed in the FMAS or will the Corps elect to stay with biased theory provided by biased environmentalist?	The FMAS goes far afield to justify "floodplain management", but does not attempt to identify and evaluate for the American people, the billions of dollars needed to transform the viable economic systems now in place, because of flood control, into a system of "floodplain management", or the billions of dollars lost because of the prohibition against development along Midwest's link to World

20% greater, and a levee configuration adequate to have prevented the 1993 flood. The UNET Model navigation are one mission. How can these statements be made, while the same report makes it very In the public hearings, request for the Corps to perform physical modeling to confirm the UNET Model How about the additional expenses of very expensive maintenance and eventual loss of navigation, if altered, to actual facts. How, someone tell me, can a theoretical model be adjusted to facts, if there was calibrated to actual events and physical tests, which in layman terms means tweaked, adjusted, Surely, an engineering company can realize the implications and devastating impact upon the future Please, forward copies of all appendices and other papers and references, used to verify this report. of local and national economies of these positions. A report with this magnitude of impact, must not The report clearly states that the river will meander in the Middle Mississippi and the Missouri River, information which is already being taken by the public as factual, without proving that the theory can are improved, see "Flood Threat Pits Farms Against Cities", St. Louis Post Dispatch, May 7, 1995. The UMFCA respectfully requests that the alternative of levees along the major navigable rivers, adequate to prevent the 1993 flood, be verified with physical models at the Waterways Experiment The UNET Model has been calibrated by past flood events and by physical model test of the 1973, The animosity being built by the environmental community, between the citizens along the Midwest Where are the values for support of the navigation system, and the loss to the national economy? 1982, and 1983 flows at St. Louis. The UNET Model has not been calibrated with the 1993 flows, major rivers, will be increased if this report implies a threat to the urban areas if agricultural levees be filled with unsubstantiated opinions or cut short by political agendas, and must be, as nearly as clear, that the Upper Mississippi does not need levees to prevent the river from meandering, and Please refer to item 5 of the attached comments. The UNET Model which has been used in the without bank stabilization afforded by the levees, and in the Lower Mississippi flood control and Upon completion of the final draft, please forward the complete report with all attachments. was explained as unnecessary. Surely, an engineering company, is not satisfied to publish FMAS to predict flood stages, of 1993 flows with levees adequate to prevent flooding. what about the Illinois. In all these areas the water and soil are the same. the levee systems are abandoned, or diminished, to allow flooding? possible, proven by solid engineering methods. be proven by nature or in the laboratory. COMMENT OR QUESTION Station in Vicksburg, Mississippi. are none? CODE 9

CODE COMMENT OR QUESTION The continued concern and consideration by the United States Army Corps of Engineers, of our concerns and ideas is appreciated.	Nancy and I appreciated the time you and your staff spent with us discussing the Upper Mississippi 2/27/95 Floodplain Management Assessment. I welcomed the opportunity to explore, in depth, the hydrologic work you are doing and I look forward, at some later date, to reviewing the results. I remain concerned, however, about the hydrologic and hydraulic analyses that you are performing relative to the effects that wetlands may, or may not, have on flooding, since these tools do not take into consideration the spatial and temporal effects that wetlands exert on the hydrological cycle. In regard to this concern, I offer the following:	While wetlands can be found at almost any landscape setting from hillsides to coastal plains, the significant wetlands relative to flooding are generally founding and amount low gradient landscapes. As the water generated by the uplands moves through these landscapes, it forms and sustains marshes, lakes, sloughs and streams. Whether palustrine, lacustrine or riverine, these wetlands convey, store and distribute water. In earlier times, in fact, they dominated the hydrologic structure of North American streams.	The functions and values of aquatic ecosystems — flood storage, water quality maintenance and others — are tied inextricably to the hydrologic components of wetlands. Regardless of wetland type, water encompassed in these landscape units is subject to numerous hydrologic processes: interception storage, evaporation, infiltration, percolation, surface and groundwater storage, evapotranspiration, groundwater recharge and discharge, and streamflow. To represent these components as independent, separate, conservative (no losses) functions at any juncture within this complex hydrologic hydraulic system, is to misrepresent reality. These components subtract or add to their effect at every storage node and step along the flow path. As the water moves down	landscape, into and through adjourning wetlands and along sloughs, streams or rivers, the hydrologic processes continue to operate. Significant quantities of water are trapped on the floodplains and in back-water areas, while vast quantities are evaporated and transpired from surface waters and removed from ground water and soils storage by evapotranspiration. Some water leaves the system through infiltration and percolation while other water returns from the soil and ground water storage. Even in incised streams, these processes continue to operate, albeit at a reduced level.	In larger watersheds and where hydraulic efficiency is low, the hydrologic processes have more time to act and affect the overall yield and flow distribution. These effects can be readily observed in recorded streamflow: for example, compare the flow of the Mississippi River north of St. Paul with the Minnesota River at Minneapolis, or contrast the yield of an agricultural watershed with that of an urban watershed. In the case of an agricultural watershed, the yield may be perhaps eight inches per year whereas, in an urban watershed, it can be higher than twelve inches per year.	To analyze the effects of wetlands on the hydrology and hydraulics of a watershed, the analytical

procedures must reflect the related physical processes. For a short reach of stream, particularly one that has been channelized, these might not be significant, but in extreme events, at the watershed scale, they are. They are certainly important in the consideration of basins associated with the mainstern and tributaries of the Mississippi River.	portion, both the hydrologic and hydraulic analyses must reflect and integrate these phenomena. Water exchanges across the boundaries of air and land must be represented. There is certainly adequate time as water moves down the mainstem of the Mississippi for additional interception storage losses, evaporation, infiltration and percolation. The analytical procedure cannot adequately represent reality if an underlying assumption precludes important processes, for example, conservation of mass within the channel system.	In short, HEC/1 and HEC/2 reflect some of the physical phenomenon, but not enough to serve as tools to evaluate the effects of wetlands on streamflow or flood flows. These models do not adequately reflect the influence of wetlands on the time and space distribution of water. I would recommend that a full water budget analyses be undertaken as part of the FPMA, even if only on a sub-watershed basis. Such an analysis could provide the quantitative assessment of the importance of the relevant hydrologic functions and, at the same time, point the direction to future analyses. We certainly have, today, the capability to run a water budget for the entire Mississippi River or one of its sub-basins. Our computer systems are robust enough and our models sufficiently well formed to accomplish this task. Doing less is denying twenty years of research and experience.	T.		To the best of our recollection and information contained in our files, we have not been notified of previous meetings, and were not aware of the scope of this study. Our comments may be more wide-ranging than the Corps would like at this point of the proceedings. However, we cannot participate in meetings we are either unaware of, or are unaware of the scope of the Assessment that includes activities which affect our members. Had we known the scope of the Assessment, and of the previous public meetings, you may be assured you would have heard from our Association before this time. It is apparent the Corps has put a great deal of time and effort into this Assessment, and has done some excellent work. We regret our involvement has come so late in the proceedings and any inconvenience it may cause.

CODE COMMENT OR QUESTION

are not to simply complain, but are offered as a service to help the Corps, Congress, and to address The congressional authorized scope of the Assessment is to study the flood control needs of certain comments will center on factual deficiencies, general deficiencies, and omissions. Our comments areas which we believe are important and necessary to complete the Assessment, and hopefully areas. Therefore, it is to identify problems and look at alternatives to present conditions. Our lead to needed improvements in floodplain management.

General Comments

dikes as they relate to the Osage River.) It is not that compensation cannot be done; it is a matter that seeking the ability to compensate for that portion of the damages which are caused, or made greater, by federal actions. (See sections relating to Truman and Bagnell Dam, Lock and Dam #1 and Trainer survival of their business interests, and care for their property. This aspect of floodplain management waterway under federal jurisdiction is exposed to the same tax rate and to making the same required measure of protection from federal actions which would harm them. The federal government has decisions is the lack of respect by the federal government for the property of others. One of the 1. Our experiences with federal government flood control projects and floodplain management has been generally overlooked in the Assessment. Where flow regimes of a stream have been persons to accommodate the majority or one special interest. The reasoning that your live in a payments, must be dropped by the federal government. Each person owning property along a contribution to the federal government in the form of taxes. Therefore, each individual merits a done a good job of obtaining the authority to regulate. It now needs to be equally as diligent in cornerstones of good floodplain management should be respect for the property of others, the altered by federal actions and greater flood, other burdens are shifted on to a smaller group of floodplain and the responsibility is yours, or you should survive on flood insurance or disaster it is not being done!

alternatives, it may not be considered for further funding. We do not believe, based on the authorizing section ATT, it clearly states the lower Missouri River and its tributaries that were flooded in 1993 are 2. It appears that the scope of the study has been changed from what was ordered by Congress. In We cannot comment on the needs of other tributaries or their needs. We can state the members of sufficient funds were not provided to study tributaries. Again, persons living along a tributary of the tributaries appears to be government by bureaucratic powers rather than government by legislation. NOTE: Information pertaining to the Osage River, Trainer Dikes, and Osage Lock & Dam omitted. lower Missouri River are exposed to the same tax rates as persons living along the Mississippi and Missouri Rivers, and deserve the same consideration in the Assessment. The fact the Corps has spent the vast majority of funds on the Missouri and Mississippi Rivers and generally ignored the actions. If the Osage River is not included and its problems identified and addressed with action to be included. The explanation given at the April 19th meeting in Jefferson City, MO, was that Assessment, alone or in combination with other studies, result in further study or other federal this Association wish to have the needs of the Osage River included, should a review of this documents contained in the Assessment, it allows the Corps to exclude the Osage River.

General Comments on things contained in the Assessment:

1. Page 1, paragraph 4 - Talks about the high degree of cooperation between the Corps, Natural

River system stored the THIRD LARGEST AMOUNT OF WATER AND DID MORE THAN ITS SHARE IN CONSIDERATION AS THE MISSOURI AND MISSISSIPPI RIVERS FROM THE FUNDS REMAINING. the Levee Heights at a 25 year level. It may have reduced flooding in the 1993 event. However, it may meetings, although a study on floodplain management does ring a bell. We cannot remember why, if PROTECTING THE MISSOURI AND MISSISSIPPI RIVERS. WE NOW NEED RELIEF FROM THE 6. Missouri FPMA counties - page 7-10, paragraph 2 - Miller County sustained damage in the flood of involved previous stated in Comment 1 of this section. We cannot recall being informed of any of the mouth of the Osage River. We cannot afford to donate any more property to the federal government. emphasis on "this is what we found out" vs the "what do you need portions." This goes a long way to There is no representation of the we were informed of any of the meetings, we would have taken the term floodplain management as Secondly, as previous stated, based on the amount of water stored in a reservoir system, the Osage 2. We totally agree with the statement made in the last paragraph on page 1. An example would be 4. Page I-2 - Study Area - As previously stated, authorizing document shows what the scope of the Protection Agency, Fish and Wildlife Service, and the states. It appears on this level of organization be shown this proposal would increase river heights on floods under the 25 year event. It has been proposals, as no information is given as to changes in water levels for the Action Alternatives at the 1994, and was designed to educate the public and obtain information, and shows four locations for responsible when a change in flow regime produces greater damage due to a federal action. The 8. Chapter 11 - Desires of Effected Interests - states the first set of meetings was held in June of federal government. Flood insurance does not fully compensate for damages and in some cases funds, or spend any time on new projects until the problems associated with existing projects are study is to be. We question the Corps authority to limit the scope to less than what is authorized. 7. Page 9-23 Urban Levees - We strongly recommend the Kansas City District not be given any discredit the Assessment, and raise outcries rather than support, along with the special interests attitude expressed that residual flooding is the landowners responsibility must be dropped by the this set of meetings. The second set was held to obtain interests and concerns in two locations. 3. Responsibility for residual flooding, page 2, paragraph 7 - The federal government should be Resources Conservation Service, Federal Emergency Management Agency, US Environmental our experience with the series of smaller floods produced by the Truman Dam, a series of small locations. It appears the public input portion having less meetings (meeting 1 and 2) having six 5. Chapter 9 - Evaluation of Action Alternatives - It is difficult for us to comment on the specific THEREFORE WE ARE AGAIN REQUESTING THE OSAGE RIVER BE GIVEN THE SAME The third set was designed to educate the public by providing findings and conclusions in nine floods can be just as costly as a large flood. This would shift the burden of flooding onto the locations vs nine locations where results and conclusions were presented, show a heavier navigational or agricultural interests. This can sometimes skew the direction of a study. We certainly cannot afford any alternatives which would cause greater damages. unprotected areas. Concentrating only on one large event is a mistake. the parties involved are heavily loaded with environmental interests. 1993. It cannot be excluded from the Assessment. FEDERAL GOVERNMENT'S ACTIVITIES. COMMENT OR QUESTION flood insurance is not practical.

meaning such things as where houses are built, where barns are permitted to be built, town, etc., and we would not have taken it to mean a wide-ranging study on flood control projects. We could have heard a partial explanation of a floodplain management meeting through the media after or before the fact, which would have lead us to believe there was nothing of interest to our Association, or could have heard something about the Preferred Alternative on the regulation of the Missouri River and are confusing it with the Assessment. The Kansas City District knows of our interest in these matters and we should have been informed. The relatively small number of persons showing an interest in any one area on Page 11-4a speaks more to the lack of meeting location, than a lack of concern.	Closing Comments: While good floodplain management does take structures, the number one need in floodplain management is the federal government's need to change their attitude towards the property of others. As it applies to the Osage River, for example, in the additional flooding, denied access, and affected land must be addressed, and the problems solved at the expense of the federal government in a manner which will allow farms and businesses to remain viable economic units as they are passed from father to son, or person to person. As it relates to the Lock and Dam, congress gave the Corps the authority to prepare this project for abandonment, and it was not done in a proper manner. In each of the areas outlined in our specific needs of the Osage River, in each case the problems should be considered a project cost, and considered regardless as to whether each individual item is cost effective. It is almost impossible for an individual to overcome the damages caused by major federal actions, and the cost effectiveness of the tax paying citizens should come first in this area.	The section on Bagnell Dam was done by our memory of events. We believe our statements are true and correct but are susceptible to errors. The time we have had to prepare this statement has been short, and we did not have time to gather and review all facts as they relate to the 1993 event.	If there is anyone who remains skeptical as to whether major errors occurred in the design of Truman Dam, and whether this project is functioning as designed, we suggest you review the power portion of this project and compare what was expected to occur with 1995 reality.	We also would like to warn the readers should the Corps respond to this letter, generally the Corps statements as to dollar benefits attributable to a project or not subtract the costs of additional damage attributable to the project from the benefit.	We do not enjoy pointing out what we believe are errors of others; however, it is necessary in reviewing this Assessment. We make mistakes like everyone else, but it does not change the fact, we need the federal government to take responsibility for the damage which they are creating.	Please review the hydrologic modeling which considered all levees surviving the 1993 flood, would 5/3/95 have produced a 7 foot higher crest at St. Louis.	The model is obviously not correct. The Kansas City reach, 7.5 miles and 1500 feet wide, and the St.

Louis reach, 20 miles and 2200 to 3300 feet wide, only increased the stage 1 to 2 feet through these areas. Louis reach, 20 miles and 2200 to 3300 feet wide, only increased the stage 1 to 2 feet through these areas. The gradient was not changed and all of the 1993 flood waters flowed through these areas. The model is not correct. Before the Corps makes such a definitive state, (all levees surviving the 1993 flood would have produced a 7 foot higher crest at St. Louis), there must be verification, either by the 1993 flood or a physical model at the Mississippi Basin Model, Clinton, Mississippi. If the hydrologic modeling remains as presently stated, the above assumption would be devastating to flood control in the Upper Valley.	The third paragraph of page 9-17 entitled "Change in Value of Floodplain Resources." states: "With agricultural levees removed, the market value of the crop acres impacted could be reduced by about agricultural levees removed, the market value of the crop acres impacted could be reduced by about 20% overall." This is a gross understatement. With the high costs of chemicals, seed, fertilizers, and machinery, farmers cannot farm unprotected agricultural land today. Today's inputs amount to about 75% of the value of the harvested crops and the crop insurance premiums on such high risk fields would take most of the balance. No successful farmer would take such a risk. You are correct that "the net agricultural produce would be drastically reduced"	Bottom land which is protected by levees commonly commands a price of \$1000 per acre or more. To place a crop at the risk of flooding every two or three years would be a clear road to bankruptcy. Bottom land without levees is not fit for agricultural purposes, and the policy of removing the agricultural levees would reduce the value of the land from agricultural to a recreational value of about \$150 per acre. After the land is allowed to remain idle for a five year period in a wetlands condition, recreation is the only possible value that would remain. Soft wood river timber is not fit for any profitable forestry program. By removing the agricultural levees, the value of the land would be reduced by roughly 85%.	It is doubtful that the removal of the levees and resulting agricultural loss would lead to any reduction of flood crests more than a few inches in urban communities. In fact, the third paragraph on page 12-3 states: "Converting floodplain agricultural land to wetlands would not have reduced the stages in the 1993 Midwest Flood." Any benefits obtained by the urban dwellers, would surely not offset the exorbitant loss that would be suffered by the farming communities. The report implies that the losses in the agricultural land would be fully "offset by increased land values in communities no longer flooded." The losses might create a trivial offset for the urban dwellers but the offset would not come close to matching the cost to the farmer. The cost benefit ratio would be well below a 1:1 ratio. Moreover, this plan would unfairly place fremendous costs on the farmer and provide only slight (by the questionable UNET model only 2% to 6%), if any, benefits to the urban dweller.	In summary, the agricultural losses would include (1) the value of most of the crops which would not be produced upon the unprotected fields and (2) about 85% of the value of the crop land. Those losses would not come close to being offset by any small benefits which might accrue to the urban dwellers.	This plan omitted the consideration of added upstream reservoirs, comparable in part to the Missouri			Lower is the stage of the stage
---	---	---	---	---	--	--	--	--

River Main Stem reservoirs. This is the only way meaningful flood control in a flood the size of the 1993 event may be achieved. In 1993 the chart on page 62 of the 1994-95 APO shows that the reservoirs prevented over 2.1 billion dollars of flood damages. The plan to prevent the farmers who farm the river bottoms to raise their levees, to fight floods, or to even require them to remove the levees for the benefit of the urban dwellers, and to call for the payment confiscatory crop insurance premiums is clearly a corrupt plan and lacks any sense of fairness. Why should there be a dual standard by which the few powerless farmers would be driven from the bottoms and the many well-connected and wealthy urban dwellers are protected in the development their valuable lowland sites? The cost benefit formulas by which their infrastructure protection is highly valued, also, clearly shows an enormous partiality to the urban dweller and the affluent business interest. It is difficult to understand any lofty virtuous social purpose which flows from this plan. The plight of the river bottom farmers who can not raise their levees or fight to protect their threatened levees during flood events is more reminiscent of the plight of unarmed Christians of ancient Rome who were placed in the Coliseum with the hungry lions and tigers and were forbidden any means of defense.	Thank you for the opportunity to provide comments for consideration as you complete the Floodplain Management Assessment of the Upper Mississippi and Lower Missouri Rivers and their Tributaries study. I have enjoyed working with the many different people assigned to prepare the report and appreciate their commitment to providing as good a product as possible in the time constraints set on the study. The following comments are for consideration by the different authors as they prepare the final document. COMMENT OR QUESTION	Insurance Program (NFIP) does not require that communities adopt zoning or any other land use	control measures. It only requires regulation of floodplains through a permit system, and that can be	a building permit, development permit, subdivisions permit, zoning permit, etc. Adoption of zoning is
FROM CODE	<u> </u>		

not a requirement of the NFIP. Some states require that communities adopt floodplain zoning,

however,

CRS credit system. Or, the communities which were contacted do not know the credit structure discount on flood insurance premiums, but this section suggests the USACE is not aware of the Page 8-8; The NFIP's Community Rating System (CRS) already allows for more than a 5% either, or they are all CRS Class 9 (5%) discount communities.

community is expected to understand and appreciate that the extra measures they are implementing Community responses to the USACE that CRS only benefits the individual insurance policy holder and not the municipality as a whole ignores the flood loss reduction benefits of the CRS. The infrastructure, etc. even though significant staff time is expended in the CRS application and contribute to less damage, less public expenditure for emergency services, protection of verification process.

of the "first-bite free" provision of the Stafford Disaster Relief Act for Public Assistance? The Act calls benefits are available. There are some private underwriters willing to carry these risks, but they often Does the USACE truly mean "private" insurance for public facilities in the discussion of the limitation umbrellas, and municipal league group coverage may also be available, but it is not clear if private for the purchase of the Standard Flood Insurance Policy to assure maximum disaster assistance impose very high deductibles and limits on occurrences. "Differences and Conditions" policies, nsurance or the NFIP's coverage is meant in this section.

benefits in the last 15 years. Elimination of these sites will have a significant positive impact on flood single greatest repetitive loss structure category we have. Some of these structures are valued at significant in terms of achieving a dramatic reduction in the overall amount of Federal disaster aid and insurance payouts..." suggests USACE is not aware that cottage lease sites are probably the \$15,000 and have received \$100,000 in flood insurance claims and additional disaster assistance Page 8-10; The USACE's determination that elimination of cottage site leases is "not highly nsurance claims payments and disaster assistance.

government "assuming more and more responsibility over time for disaster recovery costs...", USACE states claim they cannot afford the required state and local match (currently 25%) and usually request that unfortunately has come to be looked upon as an entitlement. Also, and at least as important, the needs to review Federal law on the matter. Disaster assistance is a Federal program and benefit the FEMA Director raise the Federal share to 90 or 100%. The states demand more Federal Page 8-12; We suggest that if USACE believes there is a concern existing over the Federal involvement, not Federal agencies.

Page 8-13; This section is good and gets to the point about the need to encourage state and local

proparedness planning to avoid losses, rather than constantly emphasizing the rebuild and recovery preparedness planning to avoid losses, rather than constantly emphasizing the rebuild and recovery Section 404 assistance and buyouts to people who did not carry flood insurance and how that seems to penalize those who did (because their benefit is reduced by the amount of the claim paid.) Finally, this section correctly notes there is no substantive followup of, or required compliance with, the Interagency Hazard Mitigation Team (IHMT) reports following a declared Disaster. The suggested linking of future assistance to states and locals with execution of IHMT report recommendations needs to be emphasized more here.	Of the five alternatives being studied in the Floodplain Management Assessment Study, only reducing the flow from the watershed by ten to fifteen percent would be feasible or practical.	To remove reservoirs would be unthinkable and extremely counterproductive. We need more reservoirs.	To set back levees 2000 to 3000 feet would eliminate most of the bottomland we are trying to protect. This would be the case in my area.	To remove sections of levees or reduce the height would not help either. That is exactly what happened with the first crest during the 1993 floods. That first crest breached every levee between Kansas City and St. Charles, yet the river had two more crests, each higher than the first.	raise the levees higher on the Missouri River would be expensive. It would also cause more kwater on the tributaries.	Reducing runoff is a win-win solution. Instead of spending money on flood related repairs and buy outs, this money could be better spent on holding basins to catch runoff from large shopping centers and housing developments. These basins could be designed with a permanent pool to provide fishing for the urban people. More money should be spent on terraces and dry structures. The push to no-till has helped a great deal to reduce erosion but it is not as effective as terraces in slowing runoff.	all agree that the 1993 flood caused a great deal as the 1994 Georgia and Texas floods, and the 5 California floods.	Instead of harassing the farmers in this country, we should be applying pressure and using incentives for these countries to halt their land clearing. If we really wanted to balance the budget we would stop helping these countries develop their inland water transportation systems. These systems will reduce their transportation costs and make it more profitable to raise beans in the interior areas of these countries, leading to more destruction of these valuable rainforests.	Stopping the expansion of farming in the rainforests will also reduce the direct competition with the farmers in this country. The farmers of this country are the people who raise the crops which helps
preparedness planning to avoid loss Section 404 assistance and buyouts to penalize those who did (because this section correctly notes there is no Interagency Hazard Mitigation Team linking of future assistance to states a needs to be emphasized more here. local services. And they, if they are lucky enough to make a profit, pay the income taxes that support the bureaucrats who are so willing to put them out of business. In conclusion, everyone seems to be concerned about the wildlife. Get the bureaucrats off our backs, give us a chance to make a profit and then we'll do it better than any government agency. Thank you.	Alternatives", Hydrology and Hydraulics, 9-40. The report states results of a UNET Simulation of "Action which produced a failure of the Middle cell (58,000 acres) of the Sny Island Levee District, (which did not fail during the 1993 flood), produced a reduction of stage in the Hannibal/Quincy area of 3 feet. This is a good example of the lack of reliability of computer simulated models. During the 1993 flood after every "overtoping" within 24 hours the crest was higher than before the levee "overtopped." The simulated model cannot possibly be correct, please restate this issue to reflect real conditions.	Also in chapter 9, Evaluation of "Action Alternatives," Limited Flood Fight, 9-39, the report states that "Limited Emergency Response to Agricultural Levees There would be a tradeoff of flood damages for savings by reducing or eliminating emergency levee raise restoration costs." The flood fight levee raise on the Mississippi to protect the 50,000 acres. Iowa Flint Creek Levee District #16 prevented in fighting in the entire Rock Island District. Please restate this issue to reflect the tremendous savings for flood fighting, not only in 1993 but, also during all previous floods. Another example is of the fabius River Drainage District's efforts of flood fighting was in 1960 when we saved our district from and restoring our district.	In general, we cannot agree with the report's overall underlying theme that it is less expensive to remove floodplain structures and discourage any building in the floodplain. We feel Standard Project Flood Levees would be far less expensive and the resulting revenues generated to the Federal and State governments would more than repay the cost of the Standard Project Flood Levees. Why can't we implement and obtain the same levee protection in the Upper Mississippi basin as is enjoyed in the Lower Mississippi basin from Cairo, Illinois south??	As farm operators in Bureau County, Illinois, we depend heavily on Barge transportation on the Illinois and Mississippi River and/or the Missouri River will also affect the Illinois River. Nothing is listed in your summary about the economic or ecological outcomes, even though a major portion of the state of Illinois and parts of other states are affected by your decisions. Agriculture seemed to get a very low priority in this plan, we are talking about the more productive farmland in the world.	The US Dept. of Commerce is spending our US tax dollars to build and promote the Teite-Parana Development Agency's \$655 million waterway project in South America, because of the \$20 billion of future economic development, made possible by the waterway project. This will reduce their transportation cost of soybeans by 5 fold and move 5 million tons of additional soybeans to the

international market. This could easily put the US soybean farmer out of business, because our competitive edge in World Trade now, is our affordable and efficient barge transportation system. It would also destroy more of Brazil's rain forest and many endangered species.	We also have the Conservation congress wanting to tax 10 cents per ton and passengers \$1 per head at the loading or unloading point at all docking tie ups at lake or river terminals in the state, which cuts down our meager profits even more. The only way the Midwest can participate in World Trade is if our waterways are fully developed. Europe and South America are spending billions of dollars to improve their navigation systems, and the US does little or nothing.	If the FWS and EPA are brought under control, the sediment and sand can be removed from the rivers and placed on the levee systems. The cost would be \$1.8 billion and will prevent 500 year floods. The 2 million acres protected, produce \$73 dollars an acre of taxes per year and will pay for the project in 18 years. The savings in transportation cost and economic development is the answer to rural development in the Midwest. These levied acres have paid \$12 billion in taxes, in 1993 since since being built. The damages of the 1993 flood were \$2.5 billion. Without the tax base our local schools will suffer worse than they already are. American agriculture employs 18.5 percent of the labor force, so you are not just cutting the farmer's throat. The Corps and the FWS have spent millions of dollar on numerous studies since 1979 and have not come to a conclusion. Farmers could do a better job.	If the flood control is eliminated and the levee systems are not maintained, economic development is forbidden, insurance is unaffordable, agriculture made unequal, what happens after the next flood? Europe and South America will be laughing all the way to the bank. I wish everyone in America had to spend one day in Russia standing in line for hours for a loaf of bread, perhaps our abundant food supply would not be taken for granted.	We are concerned that the impact of flooding on the Illinois River for the most part was not factored into the study. While this report was prepared only on the basis of the 1993 flood a longer history 4 / 28 / 95 must be included to get a true picture of flood conditions and the proper response to them. A history of the discharge at the Oakford Gage on the Sangamon River, a tributary of the Illinois, points out the need for a more detailed study. In 1943 the discharge at Oakford was 123,000 cu. It per sec. This was at least 10 percent of the flow at St. Louis in 1993. In 1973 it was 45,800, in 1979 it was 55,900 and in 1982 it was 71,600. Because of these limitations it's important that this study remains only that and not become the sole source for the making of rules and regulations.	We realize the area of study was restricted in its scope but we feel it is most important the fact of this limitation be noted in the final general summary. Any type of modeling must include the percent of error that might be found in the conclusion. It is probably impossible to create a model on flooding that would not include a error factor of from ten to
FROM				21 Illinois Valley Flood Control Association Virginia, IL	

COMMENT OR QUESTION fifteen percent. This information must also be in the summary. Public Health is a most important factor to include in any flood study but unfortunately was not included in the scope of this study.	There are two conclusions that we are most pleased to see in the Report. At long last it has been recognized that wetlands have very little impact on the level of flooding. The other point is an admission that levees may at times be an important factor in maintaining the navigational channel of our rivers.	We would like to take this opportunity to thank you for providing us the draft Floodplain Management Assessment (FPMA) report of the US Army Corps of Engineers (USACOE) for our review. Even though we did not have adequate time to review the whole report and its appendices with great detail, we were able to review issues related to hydrology and hydraulics. We were impressed with the number of precautions about making generalizations and explicit discussion of the limitations of the analysis and approximations made to prepare the report. However, the report still makes system-wide generalizations and conclusions based on approximate results and model results for specific conditions. We therefore believe some of the findings based on limited sets of analysis and for specific conditions may be misinterpreted and misused by non-hydrologists who might not have reviewed the assumptions made to arrive at those findings. Our major concerns related to the hydrology and hydraulics aspect of the report are summarized as follows. We hope you will take these comments into consideration when you prepare you final report.	1. Our first major concern is the use of the 1993 flood as the sole basis for evaluating floodplain management issues in the Upper Mississippi and Lower Missouri Rivers and their tributaries. As correctly noted in the report the 1993 flood was "without precedent" a unique flood. Its aerial extent and duration make it the most difficult flood to analyze and use as a basis for evaluating alternatives. Most storage facilities, man made or natural, were filled and most levees were either overtopped or breached. The long duration of the 1993 flood makes it the wrong flood to evaluate the effectiveness of upland or floodplain storage areas. An evaluation using a more general flood with shorter duration would likely result major reversals of the findings and conclusions on the effectiveness of flood storage. Thus, even though the report repeatedly cautions that the results are based on only the 1993 flood, broad and general conclusions are made that could be wrong if applied for other floods.	2. The second major concern we have on the hydraulic analysis is the choice of roughness values and the resulting findings and conclusions related to the effectiveness of floodplain conveyance. Since most people who would read this report might not understand how important and significant the roughness factor is, we would like to raise several questions. Most of the findings and conclusions related to floodplain conveyance of flood carrying capacity are based on assumed values of Manning's n. Even though a range of Manning's n is used in the hydraulic model, most of the arguments related to floodplain conveyance are based on the results of the high "n" values. The selection of n=0.32 as a realistic value for natural floodplain areas cannot be supported based on
E COO		5/5/95		
FROM		Illinois State Water Survey Hydrology Division Champaign, IL		

COMMENT OR QUESTION CODE FROM 9

For example, a USACOE model for the Illinois River uses Manning's n in the range of 0.05 to 0.100 for the floodplain. The use of 0.32 for the Mississippi River means that the Mississippi River floodplains previous studies by the USACOE or others. Since flow is inversely proportional to the Manning's n, the assumption of high Manning's n significantly reduces the conveyance capacity of the floodplain. are three to six times less efficient in conveying flood waters. How could this be justified?

flood level, flood stages would have been reduced everywhere with the maximum reduction of 4.7 feet at Grafton. These results can be relied upon because they are based on existing roughness values increase of 6.3 feet at St. Louis. On the other hand, if all the levee heights were set at the 25-year "contained" and "25-year" levee options. If levees were high enough to contain the 1993 flood the analysis results show that flood heights would be increased almost everywhere with a maximum In terms of the different levee alternatives, the most reliable and consistent results are for the and not assumed values.

Until a reasonable Manning's n can be determined and calibrated for the Mississippi floodplain, most of the findings and conclusions related to floodplain conveyance should not be used for policy making decisions that could have long-term impact on floodplain management in the region.

as the Upper Mississippi, it will be very difficult to precisely quantify the influence of wetlands on flood 3 The third issue we would like to comment on is wetland storage. The analysis assumes reduction wetlands on flood peaks and the time to peak, and not on flood volume. In a large river basin such might not reduce the total volume of runoff significantly, it has been demonstrated and proven that peaks. If the FPMA can accept the fact that wetlands can reduce flooding by up to 25 percent for in flood volume of 5 to 10 percent for evaluating the influence of wetlands. Even though wetlands smaller watershed, why then is it difficult to accept that the cumulative effects of such reductions they reduce flood peaks significantly. The important factor in this argument is the influence of would be significant for larger watersheds.

We believe the effect of wetlands in reducing flood peaks is not limited to small watersheds, even though the magnitude of the effect might be different. We do not see any significant difference between wetland storage and reservoir storage other than the control and location. One is distributed throughout the watershed, while the other one is concentrated in one location. What about evaluating the impact of wetland storage on more frequent and short duration floods? The findings and conclusions will be significantly different. This is the problem of using just one major flood to make general conclusions that are misleading.

have been difficult if a sudden levee break took place. Most of those agricultural levees failed any way. encouraging floodfighting efforts for agricultural levees at remote locations where evacuations would passed the emotional period of dealing with the difficulties and tragedies of a major natural disaster, 4. The fourth issue we would like to comment on is floodfighting and its effects. Now that we have we should be able to discuss some of the issues such as floodfighting efforts more objectively than was possible at the time of the flood. We believe a lot of people's lives were put at risk by

Based on the information presented in the report, floodfighting activities on agricultural levees appear to have increased flood stages along much of the Mississippi River, causing as much as 3.0 feet increase in peak stage near Quincy, Illinois and a 1.3 increase near St. Louis. Floodfighting reduced peak stages by 0.6 foot in only one reach of the river, that being near Chester, Illinois and Ste. Genevieve, Missouri. The analysis of the floodfighting alternative by the St. Louis and Rock Island Districts seems to conclude that the peak stages would have been reduced along most of the Mississippi River if the levees had not been built up. We believe floodfighting by a large number of untrained people at remote locations where evacuations are unreliable should be discouraged. Levees designed for specified flood heights should be allowed to be over topped when the design stages are exceeded. What is the purpose of designing levees for a 25-year flood if the levees a going to be raised during floods that exceeded the design height? It is important that if the levees are going to be increased sisk to human life and the cost both economical and psychological of floodfighting and not just how much it increases or decreases glood stages.	It seems apparent that the flood of 1993 could have been much less severe Engineers not stopped dredging some 40 years ago. The Mississippi River adding the proposed wetlands. Here in Dallas City, and I am sure, in many other towns along the Mississippi enough that the excursion boats could dock at the end of main street some can walk almost out to the island some 300 feet plus away. It stands to reason that a 5 gallon bucket half full of mud and silt will not hold Would it not be financially more sensible to dredge rather than any present processing the stands of the stands of the financially more sensible to dredge rather than any present processed to the stands of the stands of the stands of the financially more sensible to dredge rather than any present processed to the stands of the	Mississippi Flood 1 Association stone, IL 5/5/95 As As Be Refire Fire Fire Sultation

CODE COMMENT OR QUESTION Nevertheless, I seem to have a different philosophical perception of the overall flood control problem and perhaps this is the time and place to set some of my thoughts down.	 Man is inherently a builder. From the time, as a small child, he builds with blocks, he has continued to build throughout history. 	 Four-thousand years before Christ he was damming, leveling and irrigating the Tigris and Euphrates Rivers; all for the purpose of better feeding his family. 	 I need not enumerate the great works of man in harnessing the laws and forces of nature for the better use of mankind. 	4. This Country has been blessed with the greatest natural resource found anywhere in the world, the great river valleys with its rich alluvial soil, water and climate conducive to the production of food.	No man can name a greater or better natural resource. With proper husbandry, it can help feed mankind for unlimited time to come. All we need to do is accept the challenge and make use of what has been given us.	 The US Army Corps of Engineers and others with proper leadership can harness the Mississippi River and its tributaries, not free from catastrophic events, but certainly on the order of protection from a flooding frequency of once in 500 years or greater as the Standard Project Flood. 	6. One may argue, "where is the money coming from?" That is a serious question. However, with a national budget of some 350 billion yearly for welfare, 25 billion for SSI, etc., all annually, it would seem possible to squeeze out 5 to 10 billion for a one time levee improvement project (SPF) which, as in the past, would be maintained by local interests.	7. The infrastructure could be constructed over a period of several years and would return more dollars per dollar spent than any federal expenditure one can enumerate.	The St. Louis Audubon Society presents this response to the Draft Floodplain Management 4/30/95 Assessment Report dated March 1995. The comments expressed in our earlier response of 15 November 1994 are also valid to an evaluation of the Draft Report.	1. The Draft Report does not include a comprehensive review and comparison of conclusions for each of the three scenarios Three scenarios are defined in Chapter 5. In Chapter 8 the impacts, often in qualitative terms, of seven management measures are evaluated when those measures are interpreted in the light of the guiding principles for each of the three scenarios. An important exception is the evaluation of Floodplain Wetland Restoration Programs, page 8-14, where the six measures considered are not clearly related to any of the three scenarios. The "Findings" for Chapter 8 (pages 8-34 - 8-37) make no reference to any of the scenarios. The three (unnumbered tables at the end of the Chapter do describe the impacts of the several measures as applied in each
FROM									25 St. Louis Audubon Society Kirkwood, MO	

of the three scenarios, but those tables are not mentioned in the text. Some explanation is required before the reader can fully understand the implications of those tables. COMMENT OR QUESTION CODE

Alternatives" are not clearly associated with one or more of the three scenarios. Presumably that is provision of 500 year protection, etc., is clearly of primary importance to the Draft Report, yet these fragmented (analysis by Engineer District) it is difficult for the reader to pull it all together and reach Chapter 9, which discusses the evaluation of "Action Alternatives, " such as removal of levees, eft as a task for the reader. There is much useful information in Chapter 9, but because it is useful conclusions.

Likewise, Chapter 10 presents useful and interesting conclusions, but again there is no attempt to integrate these findings into the body of the report, or to evaluate their importance to an overall floodplain management plan.

which form the basis for the Draft Report. Again the reader is presented with a number of isolated Finally, the Conclusions presented in Chapter 12 are not related in any way to the three scenarios facts, but without any guidance as to how these facts may be used to guide the formulation of an overall strategic plan for floodplain management.

- contributions to river management. The need for an integrated management structure involving all of Mississippi and Lower Missouri Rivers -- Many government agencies (federal, state, and local) are 2. The Draft Report does not address the need for an integrated management plan for the Upper these organizations should be discussed. Such an integrated approach has been found useful in involved in floodplain management. Many nongovernmental organizations also make important the Chesapeake Bay Program and in the Great Lakes Program.
- to our well-being. Clean water, recharging of our underground aquifers, and habitat for waterfowl and aquatic systems are as important as flood control. Concentration on flood control and navigation has comprehensive floodplain management plan is required that recognizes the mutual importance of all aspects of floodplain management. For too long the Corps of Engineers has concentrated on flood control and navigation with no attention to the floodplain as an important ecosystem that is essential 3. Floodplain management is narrowly interpreted to include primarily flood damage control and to turned the Missouri River into an ecological disaster. The Corps should not continue to ignore disregard those ecological values usually associated with floodplain management -- A ecological values.

As an example, the Draft Report (page 8-20) presents an evaluation of the value of wetlands in flood floodplain, but those functions are clearly only side benefits that we might enjoy if wetlands had been control and mentions that wetlands also "play important roles" in fulfilling other functions on the found to result in substantially higher flood damage control benefits. 4. A Watershed Management Approach Is Needed - Agricultural practices, urban development, and flow in tributary streams in upland areas all contribute to flooding on the floodplain. The FPMA did

accounting. Simply put, our national accounts do not reflect the direct linkages between the economy change this by bridging the gap between traditional measures of economic performance and the new The Corps of Engineers should take the lead in developing methods to account for ecological values, bottomland forests restored are measured in acres or some other similar unit. The reader, who may be a Senator or Congressman, may find it difficult to compare the benefits of acres of wildlife habitat that the Corps of Engineers should lead the way in attempting a true accounting of ecological values Since we presented our November Response, we find that John C. Sawhill, President of The Nature The Floodplain Management Assessment Program is too narrowly focused on flood damage control. flood damage that may be averted, or induced. Those costs are relatively easy to estimate in dollar Those broad ecological values usually associated with floodplain management are ignored or given and the environment; we tend to undervalue our natural assets and over look the costs of declining watershed factors. On factor important to us in Missouri, for example, is channelization of tributary Conservancy, has expressed the same idea. Writing in Nature Conservancy for January/February Flood waters from several tributary rivers may reach the main river simultaneously, contributing to The conclusions presented in the Floodplain Management Assessment Program are not easily put saved with the dollar costs of restoration. In our earlier Response of 15 November we suggested long term solution must consider watershed management and not merely floodplain management. including such strategies as higher levees or removal of levees, are balanced against the costs of structure should include the variety of governmental and nongovernmental organizations that now whether benefits or losses resulting from management activities, in dollar equivalents so that they rivers an streams. When channelized, tributary rivers carry water more rapidly to the main river. contribute to the floodplain management on the Upper Mississippi and Lower Missouri Rivers. A ecosystem health. But an exciting experiment focusing on the Upper Mississippi watershed may As we said before, we believe that, among large engineering organization, the Corps is uniquely 1995, page 6, he said: "Technological advances must be matches by advances in, of all things, Much of the FPMA is essentially a cost/benefit analysis in which the costs of structural changes, 5. Ecological benefits of floodplain management strategies are not expressed as dollar values ook at such items as the role of upland wetlands in alleviating floods, but ignored many other The necessity for a continuing floodplain management structure should be recognized. That values. Associated benefits such as wildlife and aquatic habitat restored and wetlands and higher crests than would have been observed without channelization. into a context that suggests a useful floodplain management strategy. field of natural resource accounting." COMMENT OR QUESTION prepared to undertake this task. only passing attention. in dollars. FROM Ω

MMENT OR QUESTION more easily be compared with dollar costs of structural changes and flood losses.	We have followed with great interest the Corps' Floodplain Management Assessment (FPMA) which you began in January 1994. Missouri Farm Bureau staff and volunteer leaders have attended several of the public meetings on the FPMA which the Corps has sponsored in Missouri during the past year. In addition, we have reviewed your draft report and have discussed the report with several Farm Bureau members who farm Missouri River bottomland.	We are encouraged that your draft report clearly points out the reservoirs, levees, floodwalls, and other structural measures did "perform in an outstanding fashion" during the 1993 flood and prevented \$19 billion in additional damages that would have occurred had the structures not been in place.	We also concur with your finding that converting farmland to wetlands would not have impacted flooding in 1993 because most of the depressional areas were already full of water throughout the watershed.	Our biggest concern with the FPMA was that results for one of the more controversial policy options, agricultural levee setback, were not available at the time of your public meetings in April. We are particularly concerned about the handling of this option because many in the non-farm community are advocating farm levee setbacks and your assessment of this alternative will no doubt be scrutinized carefully by both the opponents and proponents of this proposal. We believe the economics of this option make it totally unacceptable regardless of the outcome of your hydraulic computer modeling.	To give you a good example of the economics involved with the levee setbacks option, we would refer you to the enclosed study conducted in Saline County, Missouri, by the Center for National Flood and Agricultural Policy (CNFAP). Please note, in particular, two findings on page 13 of the study. First, in analyzing the impact of the primary levees being setback to 2,500 feet from the current bank, the CNFAP report estimates the cost of the new levee at \$240,000/mile.	The second important finding was that with the levee at a distance of 2,500 feet from the river, over one-half of the existing farmland would lose flood protection.	When you couple the high cost of constructing new levees further away from the river along with the high percentage of farmland which would lose flood protection, the setback option is an economic impossibility for the farm community.	urge you to thoroughly analyze and prominently report the full economic consequence of the levee ack option before you issue your final report.	the opportunity to look at

Center Center Carefull without difference careful without growing a stage a based a bout compassing to the Interior conform on p. 2 what it compassed about the conformation of the Interior	Because of travel and other commitments I have read it only rapidly and have not been able to give it careful review. I have seen enough to know that it would be premature to offer detailed comments without giving it much more time.	From what I have seen I am impressed by the broad range and the new framework for analysis that your grouped has developed. More power to you!	Two points not involved in the basic analysis come to mind that you may want to consider on final drafting.	One is that the report does not stress the great range in specificity and validity of evidence on which comparisons of alternatives are ventured. For example, some of the estimates of changes in flood stage are stage are based on rather precise calculations whereas estimates of changes in flood stage are based on rather precise calculations whereas estimates of how property owners make decisions about purchasing flood insurance are based on superficial observations. It would seem important to confront the reader with the great differences among findings on such matters as those enumerated on p. 2-25. This difference in confidence enters into public decisions, and also into specification of what further research is needed.	A second minor point is historical. In referring to development of Federal floodplain management policy no reference is made to the 1966 Bureau of the Budget report in H. Doc. 455 that recommended flood insurance to serve a purpose the FIA never adequately pursued and that stressed "wise use" as a goal of Federal policy. It would seem desirable to recognize that those proposals were never achieved. I could find, on one reading, only reference to Executive Order 11296 that was recommended in the report.	As requested by Colonel Thomas Suermann, District Engineer, personnel of the US Bureau of Mines reviewed the subject notice to determine whether mineral resources or mineral production facilities would be impacted by the proposed project. The notice pertains to the draft Floodplain Management Assessment (FPMA) report that addresses management procedures and policies and how they may have contributed to the severity of the Great Midwest Flood of 1993. The FPMA resulted from cooperation between the US Army Corps of Engineers, Natural Resources Conservation Service, Federal Emergency Management Agency, US Environmental Protection Agency, US Fish and Wildlife Service, and individual state governments.	Virtually any action taken, as outlined in the text provided, probably would impact the crushed stone and sand and gravel industries. Numerous companies dredge material from the rivers, and many other operations are located along and near the river banks. Proposed changes, such as those involving levees and wetlands, could interfere with existing operations or prohibit their expansion, as well as prohibit siting new operations. Some of the alternatives discussed would require substantial amounts of construction materials in the surrounding region and the impact to operators and other

v -	Center					of M of M er,	

would occur, it should be so stated in the document. Many aggregate producers provided construction materials (primarily sand for sandbags) during the flood, with the understanding that the material would be returned or replaced. To the best of our knowledge, replacement has not occurred. Perhaps a system whereby the Federal Government provides such material for future incidents and/or reimburses those providing it should be considered.	(2. The change of policy which established "Floodplain Management" as the preferred alternative to Flood Control and Economic Development is not in the best interest of our nation. In 1960 when "Floodplain Management" was conceived it seemed like a good idea however, it has prevented flood control from being installed in the Upper Valley and is therefore directly responsible for billions of dollars in damages in the past 30 years, and continues to prevent economic development along the navigation corridors. In view of the tremendous development in all areas in the Upper Valley which have 500 year protection, the economic loss to the Midwest of the prohibition of development is a sad tale of lost opportunity but, the future loss because of world trade will be devastating.	The cost of past damages is not fully known but, any one of the previous major floods would have installed a comprehensive system that would have prevented 95% of the 1993 flooding along the navigation corridors. In view of the tremendous development in all areas in the Upper Valley which have 500 year protection, the economic loss to the Midwest of the prohibition of development is a sad tale of lost opportunity but, the future loss because of world trade will be devastating.	The greatest witness against "Floodplain Management" is that it has not prevented damages and has increased loss to the federal government, has not inproved the wildlife habitat, and has not increased or improved recreation. The UMFCA strongly opposes "Floodplain Management" and respectfully requests that the Corps does not structure this report in such a manner that will lead the American people to believe that "Floodplain Management" is a viable alternative to Flood Control and Economic Development.	If the American people and the United States Congress wishes to increase our National Park System and turn priceless land back to nature, let the decision be made upon facts and not upon misleading information in the name of flood control.	We 95 put	1. Groundwater flooding in the American Bottoms area is an issue that needs to be addressed. This area consists of the cities of Granite City, Venice, East St. Louis, Cahokia, etc., all located in the state of Illinois. These cities experienced and are still experiencing damage to their underground utilities

due to the high groundwater table during the 1993 flood. 2. The Corps of Engineers needs to consider making improvements rather than repairs to the underground utilities damaged due to the high groundwater conditions. An example is when a sewer main has failed at a certain point, the requirement was just to fix that point. A viable option would be line the sewer main from manhole to manhole with a liner. By performing the lining, you have line the sewer main from another point repair to that sewer main during another high	groundwater flooding condition. We appreciate the opportunity to offer comments on the draft Floodplain Management Assessment We appreciate the opportunity to offer comments on the draft Floodplain Management Assessment report. Members of the Department staff with a clear understanding of the 1993 Flood reviewed the document recognizing that based on the floods of 1973, 1986, 1993, and other years "government" needs to alter its approach to floods, and flood damages. With that in mind we offer the following general comments on the draft in order of priority:	 We are disappointed that the report does not focus more on flood damage reduction as opposed to flood control. Hopefully the 1993 event taught us that it is impossible to "control floods." Facing that fact, it is time to replace dated thinking regarding flood control by realizing that we cannot control floods, but we can certainly substantially reduce flood damages. 	2. There are many ways to reduce flood damages, some of which were discussed in the draft report. If government, and ultimately the taxpayers are to continue to pay for repair, restoration and rehabilitation following floods then it should be the same government that "calls the shots" regarding how and when government will foot the bill for such efforts. It would be our thinking that 25 year or less protection should be provided for agricultural areas. Such levees must be set-back some distance from the river channel to provide an adequate floodway. The Pick-Sloan Plan presented many good ideas regarding uniform levees and setbacks. Urban areas, because of their high dollar values would obviously need high levels of protection.	Federal policy must be incorporated into law that dictate how we move forward to reduce flood damage in the long term. One step in that direction would be repeal or amend Public Law 84-99. Amendments should focus on wise repair of damaged facilities, not blind rebuilding of what has been damaged or destroyed again and again.	3. Several places in the draft report suggest there is an indication that the overtopping of levees does little to reduce flood levels downstream. We question that premise. If the Missouri River floodplain contains approximately 700,000 acres of bottomland, which if levees are overtopped or damaged will store flood water 10 feet deep, that is 7 million acre feet of water an amount that exceeds total "flood control" storage in the large and very expensive reservoir systems of the Kansas River or Osage River (Table 6-3).	The report indicates that a "no levee system" would not be that beneficial since the "roughness" of floodplain would exacerbate the conveyance of flood waters. The system, in its current

configuration with levees frequently located right on the river bank has a great deal of "roughness" even when the levees are overtopped or crevassed. Floodway problems on the Missouri River have been aggravated by the removal of an estimated 100,000 acres from the riverine environment. The 100,000 acre floodway without levees would convey a large volume of water. 5. While we do not question the fact that the system of reservoirs reduced the flood levels at some lood pools, were flooded for long periods of time with severe impacts.	Reference is made to the draft Floodplain Management Assessment (FPMA) of the Upper 4 / 19/95 Mississippi and Lower Missouri Rivers and their tributaries which was recently released for public and agency review and comment.	The Illinois Department of Conservation wishes to express its concern about two specific aspects of the review process: first, the very short time period between release of the report and the public meeting dates and, second, that the Department (and presumably the other reviewing state agencies) was provided with only the executive summary and conclusions rather than the full report. Taken together, these actions seriously limit the opportunity for thorough public/agency review of and comment on the study. We are also concerned that Headquarters, US Army Corps of Engineers has not reviewed the report, thus opening up the possibility of substantial change after the opportunity for public/agency review has passed.	These concerns having been stated, there is little in the Executive Summary or in Chapter 12 (conclusions) with which the Department would take issue. Our concern is simply that the full narrative contained in the chapters cited in these documents (from which the conclusions were drawn) might present qualifying additions that weaken those conclusions we support. Our specific comments follow:	* The FPMA states that reservoirs and levees worked well to reduce flood peaks and damages, but that first priority for floodplain management should be avoidance rather than structural measures. The Department agrees.	* The FPMA states that 80% of the crop damage was not from overbank flooding. We take this to mean that flooding from on-the-site rainfall and interior drainage accounted for most of the damage. For this type of damage, watershed treatment measures and upland wetlands would appear to be a much better federal investment than floodplain levee raises. In fact the FPMA states that upland wetland restoration would provide localized flood reduction benefits in a flood such as in 1993, and even reduction on the mainstem for smaller floods. More emphasis should be placed on addressing the benefits from these measures, given that few floods will achieve the magnitude of 1993.	* In the pursuit of "furthering future understanding and enhancing floodplain management directions"

Have you considered what that would do to the tax base that supports our local schools? What about the six jobs it takes to support every farmer in his production efforts? Why improve our levees to withstand a 500 year flood? This could be done by using dredge material on our existing levees. Instead it is dumped back into the river where it is soon causing further siltation and a necessity to dredge the river that much sooner. The sand and sediment can be dredged out and placed on the levee system for a cost of \$1.8 billion and will prevent 500 year floods.	Anything you do to change the Mississippi River and/or the Missouri River will also affect the Illinois River. Yet I do not see any of the economic or ecological outcomes listed in your summary. Why? A major portion of the state of Illinois and parts of other states are affected by your decisions. You are apparently considering abandoning agricultural interests and protecting urban interests. Have you considered what that would do to the tax base that supports our local schools? What about the six jobs it takes to support every farmer in his production efforts? from Spring Valley, Illinois. We see many trucks from Wisconsin unloading there also. Anything you do to change the Mississippi River and/or the Missouri River will also affect the Illinois River. Yet I do not see any of the economic or ecological outcomes listed in your summary. Why? A major portion of the state of Illinois and parts of other states are affected by your decisions. You are apparently considering abandoning agricultural intenses and protecting urban interests. Have you considered what that would do to the tax base that supports our local schools? What about the six jobs it takes to support every farmer in his production efforts? Why improve our levees to withstand a 500 year flood? This could be done by using diredge material on our existing levees. Instead it is dumped back into the river where it is soon causing further siliation and a necessity of dredge the river that much sooner. The sand and seediment can be dredged out and places of the levee the river that much sooner. The sand and seediment can be dredged out and places of the levee the river that much sooner. The sand and seediment can be dredged out and places of the levee to stream of a cost of \$1.8 billion and will prevent 500 year floods. The 2 million acres protected, produce \$73 dollars an acre of taxes per year and will pay for the protected in 18 years. The sayings in transportation cost and economic development is the midvest. The melayor is an error of taxes per year and will pay for the protected public. In the levelopment and the midvest. The melayor is a series of \$1.8 billion in taxes, in 1993 dollars, since being built. The 1993 damages with \$2.5 billion A natural river is not navigable with modern barges. The major rivers are America's fourth coast line and have a tremendous economic potential. The Midwest can fully participate in World Trade only if our waterways are fully developed. The US Dept. of Commerce is spending US tax dollars to help plan and promote the Tiete-Parana Dept. Development Agency \$655 million	from Spring Valley, Illinois. We see many trucks from Wisconsin unloading there also. Anything you do to change the Mississippi River and/or the Missouri River will also affect the Illinois River. Yet I do not see any of the economic or ecological outcomes listed in your summary. Why? A major portion of the state of Illinois and parts of other states are affected by your decisions. You are apparently considering abandoning agricultural interests and protecting urban interests. Have you considered what that would do to the tax base that supports our local schools? What about the six jobs it takes to support every farmer in his production efforts? Why improve our levees to withstand a 500 year flood? This could be done by using dredge material on on our existing levees. Instead it is chunged back into the river where it is soon causing further sillation and an recessity to dredge the river that much sconer. The sand and sediment can be dredged out and placed on the levee system for a cost of \$1 & billion and will prevent 500 year floods. The 2 million acras protected, produce \$73 dollors an acre of taxes per year and will prevent 500 year floods. The 2 million presses protected, produce \$73 dollors and economic development is the answer to rural development in the midwest. These levied acres have paid \$12 billion in taxes, in 1993 dollars, since being built. The 1993 damages with \$2.5 billion A natural river is not navigable with modern barges. The major rivers are America's fourth coast line and have a termedous economic potential. The Midwest can fully participate in World Trade only if our waterways are fully developed. The US Dept. of Commerce is spending US tax dollars to help plan and promote the Tiete-Parana Development Agency & \$650 million waterways upoject in South America's Development Agency & \$650 million waterway project in South America's produce their transportation cost of soybeans by \$5 fold, and move 5 million not sof additional soybeans to the	from Spring Valley, Illinois. GENERAL COMMENTS FROM

now in World Trade is because of our efficient transportation system. It would result in destroying more of Brazil's rain forests and destroying endangered species.	"Observing the attitude, investments, and plans for the future, it appears that at this time, the development of inland waterways and their perceived role in the US National Transportation system and in the rest of the world look like opposites," says Dr. Anatoly Hochstein, Director of National Ports and Waterways Institute.	The Administration's Fiscal Year 1996 Budget recommendations, to reverse the federal and sponsor contributions to 25% federal and 75% local for flood control projects would virtually eliminate flood control in America. This is placing the expense of flood control on those who live next to the river, not those areas where the water originally comes from.	The Administration is attempting to change the 1936 Flood Control Act without legislation.	The EPA's requirement that the least term, piping plover, and sturgeon population can only be improved by changing the waterflow on the Missouri River is narrow-minded and extremely expensive. Why shouldn't all options be considered?	University of lowa I have reviewed the March 1995 Draft Report of the Floodplain Management Assessment. I applaud Dept. of Physics and Agronomy the generally high caliber of the work in the report, especially considering the difficulty of putting the generally high caliber of this magnitude in the limited time and budget available to your team. I am writing you to alert you to a number of inconsistencies and unsupported assertions in the discussion of the alternative of revised reservoir operation (alternative U), hoping these will be useful as you make refinements on your final version.	The source of the inconsistencies seems to arise generally from the failure to make a clear distinction between the performance of the reservoirs that were on the periphery of the flood area from those in the heart of it. The report shows clearly how those on the periphery were used to the tullest extent to mitigate down stream flooding, and hence for which revised operation would make little difference. The confusion arises in the description of the reservoirs in the heart of the flooding (those in lowa), which seems to both describe and deny the fundamental distinctions in performance they experienced. This leads to the paradoxical conclusions that revisions of the operation is both a major priority and of negligible value.	The available evidence in this and other recent COE reports seems to support the "major priority" rather than the "negligible value" viewpoint. In the following I will identify first the passages that support the former viewpoint, and then the inconsistencies in the passages that imply the latter viewpoint.	On p. 9-54, it states that "funding is being sought to study revision of the Water Control Plan for Coralville Reservoir to address changes that have occurred in the floodplain below the reservoir since the reservoir went into operation." A request for funding clearly points out the priority of the
ation system. The key factor that distinguished the performance of the lowa reservoirs, especially the relatively small reservoir could have reduced peaks by a foot or more at downstream locations on the lowa River. On streamflow. The 1990 USGS report entitled "Statistical summaries of selected lowa streamflow data through September 30, 1988" (USGS Open-File Report 90-170) gives average flow records pre- and Coralville reservoir, from that of the others is that they were essentially filled to capacity BEFORE the At the bottom of p. 6-14, it describes the revision of operating plans as having only a "slight" effect on flood reduction. On p. 9-54 the phrase "minimal impact" is used to describe changes of operation for major flooding began, and so could not be used for normal flood mitigation during the major flooding reductions from Coralville had to be disregarded after June 20th due to high pool levels, and that the presented at the public meetings, the original design of the FPMA was intended to exclude Coralville attended (in Burlington) is that it is not a cost/benefit analysis that takes into account more than 1993. that applies to the entire report. The major criticism of the report made at all of the public meetings I from consideration.) No values are quoted. However, computations made by Dave Martin at Rock alternative. Indeed it significantly understates it. The Section 216 Initial Assessment (Rock Island, the lowa reservoirs in specific. (I note that the latter quote explicitly includes Coralville, although as On p. 6-14, it notes that revisions made for 1993 apply only to 1993. This is a gratuitous statement post-regulation (1903-1958 and 1959-1988). The mean annual discharge is given as having risen positively, the purpose of the report is to identify areas that merit a cost/benefit analysis. Hence to from 1472 cfs to 2199 cfs, a dramatic 49%. Likewise the figure shows the threshold of the upper report, p. 6-9 and p. 6-14 of the FPMA describe Table 6-3 as listing the reservoir storage used to Island in January 1994 are consistent with the hypothesis that revised operations at the Coralville downstream." Perhaps the most dramatic change has been the enormous change in average in July and August. For example, in Appendix B of the COE report "The Great Flood of 1993, Sept. 1994) that was written to justify the funding cites not only downstream conditions in the pool went over 100% in the first major storm in July (pp. 53-54). In direct contradiction to this Post-Flood Report" (Sept. 1994) it notes that the down stream flooding thresholds for outflow Hence NO conclusion in the report can be used to justify any action in the field. States more quartile of years rose 2 from 2000 cfs to 3000 cfs. Similar changes have been experienced p. 9-48, similar reductions (Tables R-37, 38, 39) are referred to as of "vital importance." For floodplain but "changes in the physical, hydrologic and economic conditions upstream and consistency, "slight" and "minimal impact" could be substituted with "vital importance." mitigate major problems in July and August. COMMENT OR QUESTION throughout the upper Midwest. CODE Ω

revised operation MAY have the potential to be of vital importance in some situations, and therefore

merits a careful cost/benefit analysis.

On p. 6-15, the phrase "lessons learned" is used, but with no reference to what any such lessons

might be. None of the "lessons learned" listed in the "Post-Flood Report" mention revisions in

reservoir operation.

make p. 6-14 consistent with the spirit of the remainder of the report, the conclusion should be that

The reference to concerns about "dam safety" on p. 9-54 directly contradicts the suggestion in the same paragraph that it may be desirable to buy land to allow still higher pool levels. According to George Johnson, chief hydrologist in Rock Island, the Coralville dam is designed to hold up under pool elevations more than 20 feet higher than experienced in 1993. Finally, in the light of the preceding comments, the blanket statement in the executive summary that "Corps reservoirs performed well" needs some modification. Perhaps the world "some" could be inserted in front of "Corps." I would like to acknowledge again the difficulty of putting together a report of this magnitude under severe time constraints. I specifically applaud the honest knowledgeable responses I received from the Rock Island team at all of the public meetings in Burlington. I have dwelled on the report's shortcomings in this letter to give you the chance to clean up these points before the final draft. Hopefully this will strengthen your conclusions and the prospects for funding for the proposed Water Control study.	5/15/95
D	The Wetlands Initiative Chicago, IL

Galloway report identified \$15.6 billion, a number quoted by the Corps in its Post-Flood Report. The other environmental functions were made and the evaluations suggest that there was no consistency land values not be affected at all by changes in agricultural support policies? It is impossible to read, Chapter 5 is purely descriptive, explaining the program alternatives selected to include in each of the land values by 30-40% in Omaha, 20% in Kansas City, by \$255 million in St. Louis, and these same In Chapter 6 you describe the alternative actions, and this is a very important chapter. The problem this report. Isn't this the place to explain and resolve these non-trivial discrepancies? Likewise, the Environmental damages and, particularly, changes in real estate values, become useless categories with it is that it is not just a description of the action categories and methodology for measuring their available on the Internet) uses a figure around eight billion and you are using six and a half billion in in approach. How, for example, could the impact of removing agricultural levees reduce agricultural straightforward, such as increases or decreases in dollar amounts of damages and expenditures, or Chapter 7 describes the baseline conditions against which the changes created by the hypothetical when the analysis is applied to them. The problem is in the measurement: where measurement is At some point, for example, the discrepancy in flood damage estimates has to be dealt with. The National Flood Insurance Program is used to shift risk to the floodee, the latter is more appropriate. impact -- it mixes in much of the results of the analysis, and, as a result, is terribly confusion, since one expects to find all of the results of this analysis in Chapter 9. It is not parallel to Chapter 5, as present form. The chapter should be organized around the individual impact categories, making ranking the impacts to archaeological and historical sites on a 10-point scale, the methodology is reflection of the selection of program and policy changes which was made, but that's a matter of three scenarios. The deficiencies of the analysis of scenarios in Chapter 8 may or may not be a clear. It is not at all clear, however, how measurements of impacts on real estate values and on probably intended. Later we find that nine of the 22 final conclusions of Chapter 12 come from Economic Damage assessment being done by the LMVD (still not published, but some data is participating Corps districts is treated separately and for this reason cannot be dealt with in its conditions are measured. This is the first of two major chapters in which the input of the five Chapter 6 and only one from Chapter 9 -- another reflection of this problem. clear and definitive statement about how the final numbers were arrived at. much less draw conclusions from these table entries. Monday-morning quarterbacking. COMMENT OR QUESTION CODE <u>a</u>

(Chapter 8) and actions which could change the hydrology of the floodplain (Chapter 9) would have

chapters are pulled together, organized around the programs and actions, and then analyzed to

affected the flood of 1993. Yet it is here that the document needs the most work. If those two

dollars in the bill by which Congress first (but not last) appropriated money for the 1993 floods

exceeded your estimates of total government expenditures by two billion dollars.

directly support the findings, everything else will fall into place. The two pieces of work which those chapters describe are how the negative effects of the 1993 floods would have been lessened or ncreased under different conditions, and that is what this assessment is all about. COMMENT OR QUESTION CODE FROM 9

Chapter 8 contains descriptions of the effect of the different scenarios, organized by programs; this them. The discussion of the separate programs and policies, however, should relate directly to the tables and the analyses which they represent since it is these analyses, after all, which are the crux organization is the best one, much better than to do it than by scenarios since the scenarios only represent artificial conglomerates of different program levels with no logical connections among of the chapter.

discussion about them in the test (in contrast to Chapter 9, where the individual cells are referenced Most of the cells in the scenario tables are empty of difficult to interpret, and there is little direct in the text)

can't get it from the tables, most of latter being empty, unintelligible and even contradictory. Are we to apparently the program segments were prepared independently; neither the quality of the content nor directly followed the discussion of that program. It is even more important, however, for this is one of conclusions of the analysis? You can't get it from the text, you can't get it from the findings and you analysis. It is hard to understand why findings are included that contain mixtures of fact and opinion As for the findings, since they are fortunately also organized by program, it would be helpful if they gratuitously tells us would "produce tremendous benefits," yet "isn't feasible," would have (as the which could have (and have frequently) been derived deductively. "Legislation may be needed," "The...definition...may not be adequate," "regulation could be most effective...": where did these postulated, as follows: strong NFIP policies would affect residential flood damages by reducing table tells us) no effect on agricultural real estates values? There is, not surprisingly, no finding them slightly; and local floodplain zoning would have no effect on those damages? Or that the read the Scenario III values, for example, where the most dramatic changes in programs were the great weaknesses of the draft report, that the findings relate to and draw directly upon the related to actuarially-based crop insurance. Finally, the text in Chapter 8 is grossly uneven; actuarially-based crop insurance (scenario 3 of agricultural support policies) which the text findings come from? Certainly mot from the analysis. And where is the discussion of the the format is consistent. Chapter 8 needs a lot of work.

Chapter 9, perhaps the most important chapter in the report, is even more difficult to read. It suffers afternative actions under consideration; and consolidation of the individual districts and incorporation from the lack of consolidation of results from the five participating Corps district offices. The quality of the appropriate information from Chapter 6 is absolutely essential. At that point, as in Chapter 8, and scope of discussion and analysis varies greatly from district to district, and it is hard to imagine that the same analytical techniques were used in several cases. It needs to be organized into the findings could be developed that are related to and supported by the analyses themselves.

won't comment on Chapters 10 and 11, which are only indirectly related to the main thrust of the

COMMENT OR QUESTION project. As for the Conclusions of Chapter 12, they will be as good as the findings which come out of the prior chapters, and will be most useful if they are related directly to and organized around the specific programs and actions which it is the purpose of the assessment to examine.	This letter provides comments of the Fish and Wildlife Service (Service) regarding the draft Floodplain Management Assessment (FPMA) report distributed on March 31, 1995. We thank you for the opportunity to review this important document, and look forward to the results of further analyses and hydraulic modeling referenced in the report transmittal letter.	General Comments The Service realizes the magnitude of the Corps of Engineers' (Corps) assignments, considering the complexities of historic and current Federal water resource development policies, shifting societal goals, and technological limitations. If the report has accomplished nothing else, it has highlighted these complexities, and should give pause to those seeking simple solutions or quick fixes in the form of structural investment by the Federal government.	Overall, the report points to the need for a complete systemic physical analysis, including a hydrologic and hydraulic model to accurately estimate effects of structural and non-structural flood damage reduction alternatives. The Service wholeheartedly supports flood damage reduction alternatives through systemic analyses that consider the physical, biological, and social ramifications of all alternative measures.	The report format presents some difficulty to the reviewer, and may have resulted in our overlooking of information. The report's variable discussion of cells, alternatives, or columns, and lack of ready reference to tabled information also hindered review in some cases. The circulation of another draft prior to final report binding might be appropriate considering the incomplete analyses referenced in the report transmittal letter, along with potential format modifications, improved graphic/text connections, and grammatic/typographics errors.	Some agency reviewers anticipated the FPMA to be somewhat of a follow-up study to last year's report of the Interagency Floodplain Management Review Committee (Galloway Report). Instead, the FPMA focuses on assessing impacts and issues associated with a catastrophic event, the Flood of 1993. As a result, many alternatives and scenarios (wetland, upland, and floodplain protection and restoration), which may provide benefits to society and natural resources in managing smaller flooding events, were of little consequence in affecting a flood of this magnitude. Water management must begin in the upper watersheds and extend downstream. Once flooding occurs on the main stem, few water management options exist. From the Service's perspective, there are many benefits which could be realized from upland, wetland and floodplain restoration in reducing flooding damages from smaller events. The Service would have preferred that the FPMA look at the general issue of water management in the Midwest and not be confined to a single catastrophic flood. This would be in keeping with the study purpose identified in the report Attachment 2 - Authorization documents.

Is this truly failure or is it overtopping? the national goal of flood damage reduction. COMMENT OR QUESTION functions. CODE FROM

noted on page 12-5, along with an action plan for development of a basin-wide flood damage

reduction strategy. The first step in the action plan should be identification of an

intergovernmental/public team to ensure collaboration by stakeholders. Overall, the FPMA report restates and/or supports many of the conclusions provided by last year's interagency Floodplain Management Review Committee. As with the Galloway Report, some of the FPMA conclusions may not be readily accepted by segments of the basin population, as was acknowledged as "fundamental tension" in Chapter 2, and will undoubtedly lead to pressure to downplay those conclusions. However, as the primary Federal water resources construction agency, it will be incumbent upon the Corps to promote sound floodplain management at every possible opportunity, a task in which the Corps will have the Service's full support. On behalf of the Service, we want to take this opportunity to commend the Corps' efforts to date on the FPMA and look forward to receipt of the updated report.	Page 3-15. Top of page. The \$372 million figure for National Flood Insurance Program (NFIP) claims payments for the 1993 flood is too high. We suggest you use the \$297 million from the Interagency Floodplain Management Review Committee report "Sharing the Challenge."	Page 3-15. The Water Resources Council's Floodplain Management Guidelines are not "Draft."	Page 3-20. FEMA is unaware of a publication titled "Executive Order 11988, Floodplain Management" that is dated 1986. In 1986 FEMA did reprint the US Water Resources Council's publication of that name. However, that publication was originally printed in 1978.	Page 5-2. Scenario Descriptions. Because of the way that the scenarios are constructed, it appears that floodplain management measures have very little impact. The crux of the problem may be that floodplain management programs were already implemented and at work in the region for a number of years prior to the Midwest flood. Many of the states have had floodplain management programs for twenty or more years, the initial National Flood Insurance Program (NFIP) floodplain mapping has been completed, and nearly all communities with flood problems have adopted and are enforcing minimum standards. The Midwest floods demonstrate that these efforts generally have been successful in minimizing damages to new development either by protecting that development or by discouraging it altogether.	In addition, the Scenario I's already reflect the many changes that were incorporated into the programs after the Midwest flood. As a result, very little is left for the Scenario II's and Scenario III's and they show almost no incremental impacts. For example, Scenario I includes the changes to the NFIP in the National Flood Insurance Reform Act of 1994. This was a major piece of legislation that addressed most of the concerns and ideas that constituencies have had about how to improve the NFIP. The legislation and other actions already undertaken by FEMA address fully or in part most of the recommendations and actions in the Interagency Floodplain Management Review Committee

communities which may qualify have minimal incentives to apply because of their relatively small credits can obtain the premium discounts. However, as discussed previous, many Midwest number of flood insurance policies.

Page 8-4. Scenario I Impacts. A.2.

The observation about the federal government indiscriminately providing disaster assistance to flood whether disaster assistance encourages or perpetuates floodplain development is a legitimate issue victims should be documented and explained or removed from the report. If you are going to raise indiscriminately provided. You should not just insert it as an anonymous observation. The issue of this issue, you need to be more specific as to the type of assistance and how it is being that would require a more in depth analysis than is presented.

age 8-5. B.1.

hazard areas and are not likely to be interested in developing a mitigation plan or be funded. Third, a motivated to develop a mitigation plan. For example, of the over 18,500 communities participating in properties. Realistically, these communities are likely candidates for mitigation plans. Many of the funding considerably more than 30 plans a year. These plans will largely be developed using local resources and will not require a high level of funding. Second, it is anticipated that only a relatively 3,972 communities in the seven states have no development or only a few structures in their flood The impact of the \$1.5 million funding for mitigation plans is understated. First, FEMA anticipates small percentage of NFIP participating communities have enough buildings in the floodplain to be the NFIP, less than 800 in the nation and 128 in the seven states have 10 or more repetitive loss number of the communities with significant flood hazards have already completed mitigation or floodplain management plans using their own resources.

Page 8-7. Scenario I Impacts, A.1. and 2.

communities with significant flood hazard areas in the Midwest states impacted already participated The fact that there was only a 2 percent increase in community participation indicates that nearly all communities are left to join the program. A community can be mapped and have special flood hazard areas designated and have no existing floodprone development or potential for next in the NFIP prior to the flood. The impact of this scenario over time is minimal since few development.

already do. However, the community does have to make application. Low NFIP policy counts make Many communities in the Midwest could qualify for 5 or 10 percent discounts based on activities they It is possible to obtain premium discounts with little or no investment on the part of the community. Page 8-8. Scenario II Impacts. B. See prior discussions of the Community Rating System. this effort less attractive in the Midwest than in other parts of the nation with more floodplain development.

Page 8-8. Scenario III Impacts. C. 1.

Requiring communities to obtain private insurance would probably increase protection levees. If local units of government must obtain private insurance for their infrastructure, this in itself is an incentive

Waterworks upgraded their levee and took other mitigation measures in part so they could retain their to protect those facilities since the cost of the insurance will depend on the risk. The Des Moines COMMENT OR QUESTION CODE ₾

Page 8-9. Scenario III, Impacts 3.

private insurance coverage at affordable rates.

Losses to public facilities were high in relation to total expenditures. FEMA expenditures for infrastructure nearly equaled that for Human Service (see "Sharing the Challenge").

Page 8-9. Scenario I. Measures.

Again, buyouts should exceed 8,000 buildings. The key provision of the PL 103-181 that resulted in increased funding was not the change of the cost share. It was the change in the formula for determining how much hazard mitigation funds would be available.

Page 8-11. Top full paragraph.

relocated, or floodproofed in the few months after the flood. The National Flood Insurance Reform Act a provision in the National Flood Insurance Reform Act of 1994 that does just that. The Act authorizes does not change the definition of substantial improvement in NFIP floodplain management criteria so In regards to the issue of making flood hazard mitigation funds available quickly after a flood, there is compliance with local floodplain management regulations (mitigation insurance). This coverage should be in effect for new and renewal policies beginning on October 1, 1996. Payments would be made through the flood insurance claims adjustment process. If this coverage had been in effect that it is cumulative. It defines repetitive loss structure and includes such structures as eligible for prior to the Midwest flood, several thousand buildings would have been elevated, demolished, FEMA to provide coverage in the flood insurance policy for the cost of bringing buildings into mitigation insurance coverage.

Page 8-13. Top full paragraph.

not all of this is cost/shared. Going from 90% to 75% for the federal share will not result in this high a The \$375 million savings appears to be overstated. Total FEMA assistance was under \$1 billion and savings.

Page 8-34, 8-a)

flood problems by forcing them into the NFIP. While there are a few communities that are not eligible for the NFIP that should be, most nonparticipating communities with their flood hazard areas mapped have minimal or no existing floodplain development or potential development. The benefits of these Caution must be exercised to avoid placing administrative burdens on communities with minimal communities joining the NFIP are marginal.

Page 8-34, 8-b)

Note that there is already a deductible in the Stafford Act for Infrastructure assistance for buildings that is equal to the amount of flood insurance coverage that the community could have purchased. NFIP coverage is not available for other infrastructure.

COMMENT OR QUESTION Page 8-34. 8-c) ₫

percent of the NFIP claims paid between 1978 and 1993 have been made on buildings in B, C, and X zones. For the Midwest Flood only 2,483 out of 16,167 claims filed were in B, C, and X zones. Note it behinds levees). These types of problems do not lend themselves to floodplain mapping. Also, 24 sewer back-up, inadequate storm sewers or other drainage problems or high groundwater (some of Some caution should be used before concluding that there is a problem with the FEMA definition of floodplain were in the City of Chicago or in Cook County, Illinois and has basements flooded due to "floodplain location." Many of the buildings that were flooded that were outside the 100-year that B, C, and X zone buildings as a class are actuarially rated and not subsidized.

Page 8-35, 8-i)

Infrastructure assistance. The new formula is based on 15 percent of all FEMA assistance, including The formula for determining the Hazard Mitigation Grant Program Funds was 10 percent of FEMA Infrastructure and Human Services assistance, less administrative costs. The additional 5 percent and the inclusion of the Human Services assistance significantly increased the amount of funds available.

Page 10-15, 5)

cannot cause any increase in flood stage. Buildings must be elevated or floodproofed to the 100 year administrative procedures. FEMA minimum floodplain management criteria at 44 CFR 60.3(d) limit FEMA Regional Offices and by states to reflect any more restrictive state standards or unique state or base flood elevation. The one foot freeboard also is a more restrictive requirement of several of increases in flood stage when floodways are designated by communities to no more than one foot. There is no such thing as a single FEMA model ordinance. Model ordinances are developed by recognizes in its mapping. Once a floodway has been designated, obstructions in that floodway Several of the States in the study area have more restrictive surcharge limitations which FEMA the states.

Page 10-16. Top paragraph.

All of the states have state enabling legislation that allows communities to adopt and enforce local instances there is direct state regulation of some floodplain development. All of the states have adoption of floodplain management ordinances by communities. These regulations often have floodplain management ordinances necessary for local ordinances and independently require some provisions that are more restrictive than NFIP minimum requirement. In some limited communities that are not eligible from the NFIP or which are suspended from the program.

Page 10-17. Table.

within the state that participate in the NFIP must comply with NFIP minimum requirements. It would make more sense to title this table "State Floodplain Management Requirements" and just indicate State of Missouri does not have state floodplain management regulations. However, communities This table is misleading. These are not "state ordinances." States do not adopt ordinances. The that Missouri has no state regulations.

Page 10-18. Findings. 10-i) It would be more correct to state that six states have adopted state floodplain management statutes or regulations. All communities in all states are subject to the minimum standards of the NFIP. 10-k) and 10-1) These are meaningless comparisons. Some states have more communities that have floodplain maps, but no floodplain development and no potential for development. There is little incentive for these communities to join the program and little need. More significant would be	Page 10-20. Background. We suggest that you do not use the Donnelly data from the Assessment Report of 1992. This data probably considerably overstates the numbers of floodprone households in most of the Midwest states. The Donnelly estimates were developed by assuming that households are uniformly distributed across the community. Donnelly multiplied the percentage of land area in the community that is floodplain times the number of households in the community to get floodplain households. Since many floodplains in the more urban areas of the Midwest tend to be used for agriculture or open space or are wetlands, this methodology is highly questionable.	Page 10-24. First paragraph. Again, B, C, and X zone losses for the NFIP for the years 1978-93 were 24 percent of all losses. Many of these losses are in areas with localized drainage problems which are too small to warrant the cost of floodplain mapping. These urban stormwater management problems that are really beyond the scope of the NFIP and are the responsibility of the individual community. There is also a question of definition in regards to the 40 percent estimated to be out of the floodplain for the Midwest flood. Sewer back-up may be caused by high groundwater resulting from heavy rainfall and not directly related to a general condition of flooding.	Page 10-27. Full paragraph 2. Flood insurance does not subsidize new development within the 100 year floodplain. Rates are fully actuarial. The situation behind a levee that has been accorded 100 year protection is more complicated. It may be that removal of the floodplain designation has a greater impact on whether the area will develop than the expectation of subsidized insurance or disaster assistance. Empirical evidence of this is the low level of flood insurance that was in force in Chesterfield prior to the Midwest flood. Also, businesses would qualify only for SBA loans is flooding occurred. It is difficult to view the expectation of a disaster loan as a subsidy encouraging development even if the interest rate is below market.	5/12/95

the FPMA, the Corps encouraged state resource agencies to actively participate in the reports' the FPMA, the Corps encouraged state resource agencies to actively participate in the reports' the FPMA, the Corps encouraged state hardest hit by the Midwest Flood of 1993, Missouri had a great interest in development. As the state hardest hit by the Midwest Flood of 1993, Missouri providing comments that would make the FPMA results useful to state and local governments providing comments that would make the FPMA results useful to state and local governments currently grappling with the complexities of floodplain management issues. The Missouri Department of Natural Resources committed staff time and resources early on and throughout the process to travel to workshops, review drafts, and to provide constructive, detailed suggestions.	In reviewing the draft FPMA report, it is apparent that our time, effort and resources have been wasted. Regrettably, only one of our recommendations to correct serious flaws in the FPMA has been considered, and incompletely at that. Although not included in the draft report. the Corps has agreed to hydraulically model the levee set back alternative. However the associated environmental, economic and social effects will not be evaluated, as they will with the other alternatives.	Attached is a letter to Dr. John Zirschky, Acting Secretary of Civil works regarding the Corps of Engineer's Floodplain Management Assessment (FPMA). The letter was jointly signed by the Missouri Department of Natural Resources, the Missouri Department of Conservation, and the State Emergency Management Agency. Also attached is Dr. Zirschky's response letter.	In short, the FPMA fails to address the hydrologic and hydraulic conditions of Missouri River flooding. We remain concerned that the FPMA will provide misleading results to state and local governments who will likely use them as a basis for making or revising floodplain management policies.	Thank you for the opportunity to review and comment on the above-referenced report. Considerable thank you for the opportunity to review and comment on the above-referenced effort in a timely time and energy have been put forth to coordinate and complete this broad-based effort in a timely time and energy have been put forth to confide the issues contained in the report. 5/11/95 manner. Our comments are not intended to address all of the issues contained in the report that we support, questions and concerns about the report, and specific corrections needed in the report as they relate to the State of Nebraska.	The Assessment does a very good job of stressing the importance of evaluating hydraulic impacts systemically. The development and use of the UNET mmodel was an excellent first-step in this process.	The discussions involving the challenge to ensure that decisions regarding floodplain use are made with full recognition and acceptance of risks and potential costs associated with living, working, or investing floodplain locations are right on target.	The case study on the Chesterfield-Monarch area and the discussion in Chapter 10 on the residual flood risks and induced development associated with structural flood control projects are very insightful and these concepts should be recognized in a future project development and design.	The major weakness of the report is that it is a one-agency report. A true multi-agency approach would assure that the unique floodplain management perspectives and insights of all agencies were presented. Although considerable effort was made to involve other federal and state agencies there

are numerous places in the report where other federal and state agencies, there are numerous places in the report where other federal and state agency programs are not depicted accurately. Hopefully, many of these inaccuracies will be addressed during the comment period.	The description of the evaluation process used for the Assessment is very confusing and spans six chapters. The matrix tables and cell descriptions are of limited value to the reader and might best be presented in an Appendix.	The "Findings" at the end of each chapter should be reviewed to assure that they are well	On page 8-4, the third bullet point should read: "Nebraska has had an active floodplain management program since 1967, and has not made changes in the program as a result of the "Flood of 93."	On page 8-29, the sentence in paragraph six should read: "The Papio-Missouri River Natural Resources District (NRD)"	On page 10-14, the second paragraph should also reflect state and local standards required for floodplain and floodway development.	On page 10-15, the FEMA requirements stated are not correct and should be reviewed.	On page 10-16, in reference to the first bullet point, Nebraska does not require state permits for floodplain development. In reference to the second bullet point, the state does not specifically prohibit the development of hazardous waste facilities within floodways (although it would be very difficult to locate such a facility in the floodway). It should be recognized that the state does prohibit new structures for human habitation in the floodway and reuires all structures to be elevated at least one foot above the 100 year floodplain. I have included for your information a copy of "Statutes Relating to Flood Plain Management" and the Nebraska Natural Resources Commission's "Minimum Standards for Floodplain Management Programs."	The table on page 10-17 should be corrected to reflect the state exceeding NFIP requirements in floodways and for siting critical facilities.	On page 10-18, 10-o) should read: "Five of the seven FPMA States (Nebraska, Illinois," 10-p) should read: "The states of Nebraska, Iowa,"	Again, we do appreciate the opportunity for reviewing the report. The development of the UNET models to look at system wide effects provided an excellent "end product" for this study effort. Finally, we do look toward a collaborative future effort to prevent unwise development decisions in floodplains.

COMMENT OR QUESTION CODE 9

The Great Flood of 1993, the most destructive flood nationally in more than 50 years, changes the way the nation calculates the economic and social costs of floodplain development. Rather than businesses from harm's way. The largest voluntary relocation in our nation's history has inspired return to the river's edge, thousands of people voluntarily relocated more than 8,000 homes and floodplain residents in Texas, Georgia and California to seek higher ground as well. More than an exodus, the nation's response to the Great Flood of 1993 was a thorough repudiation of many long-held flood control and agricultural policies. Indeed, the Floodplain Management Assessment contains several important findings that support this view:

* Raising agricultural levees would increase flood heights.

Mississippi to prevent overtopping in the 1993 event, flood stages would have been an average of The Assessment concludes that by raising and strengthening agricultural levees along the Middle increase flood damages in St. Louis, St. Louis County, St. Charles County and in the Mississippi about 6 feet higher. Raising all agricultural levees to contain the 1993 flood would substantially River floodplain below St. Louis.

significantly increase flood damages in 993. In some cases, setting back levees was shown to be Adopting a 25-year level of protection for all agricultural levees would cost nearlt \$6 billion and an effective way to reduce flood losses.

Wetlands can help reduce flood losses.

areas are small. Several case studies reviewed by the Assessment indicate that flood peaks can be reduced significantly for fairly frequent flood events. In addition to reducing flood losses, wetlands Although wetland restoration would not have substantially reduced damages caused by the Great Flood of 1993, wetlands can reduce local flooding by as much as 25 percent where contributing restoration can also improve water quality, wildlife habitat and groundwater recharge benefits.

place between the main channel and the floodplain. Although the extent and magnitude of floodplain Allowing the river to interact with parts of its floodplain is a key link in the Mississippi's food chain. areas would allow the river to resume limited interaction with it floodplain and reduce payments for A flood is the major in way by which exchanges of nutrients, organic matter, and organisms take floodplain that would continue to be farmed, the Assessment concludes that acquisition of these acreage suitable for conversion or restoration is considered to be quite small in comparison with agricultural damages.

Current theories on floodplain functions predict that the area needed for an improvement to te natural biota is probably small and that restoration of a series of natural floodplain patchs - a string of beads Unfortunately, acquisition programs are underfunded relative to the interest in participating in these -- connected to the river would be practical and beneficial. Agricultural subsidies that facilitate farming in areas that would otherwise not be farmed should be reviewed and reformed.

American Rivers applauds the Corps' Floodplain Management Assessment and urges you to work with Congress and the Clinton Administration to: 1) implement a series of wetlands demonstration

projects throughout the Upper Mississippi and Lower Missouri rivers basins; 2) create an Environmental Management Program (EMP) for the Missouri River and allow this program and the existing program on the Upper Mississippi to engage in the existing program on the Upper Mississippi River to engage in habitat acquisition; and 3) use existing wellands restoration programs, including an expanded Section 1135 program, the Conservation Reserve Program (CRP) and the Wetland Reserve Program (WRP), to protect and restore floodplain wetlands.	In preparation for the final draft of the Assessment, we urge you to further develop the economic and environmental benefits of wetlands and floodplain restoration. The beauty and diverse history of the Upper Mississippi River attracts more than 12 million visitors annually — more than Yellowstone National Park — generating more than \$1 billion in revenue and supporting 18,000 jobs. Despite its degraded state, Missouri River recreation generates \$76 million annually. Recreation benefits on the Lower Missouri alone nearly exceed benefits from Missouri River navigation.	Further, we urge you to develop sit specific case studies for wetland and floodplain restoration. Since 1986, the Corps has struggled begun to redefine its mission to reflect contemporary concerns about the environment. We believe that the Corps, by using the information developed by the Floodplain Management Assessment, can undertake its greatest mission yet the restoration of the Mississippi and Missouri rivers.	On April 18, 1995, Johnny Green, Assistant State Conservation Engineer on my staff, participated in the public meeting for the draft Floodplain Management Assessment (FPMA) report which was held in Topeka, Kansas.		Thank you for the opportunity to comment on the draft report. Once again, I regret that a review could not be completed at this time. I wish you the best of luck in compliting all the comments and completing the final copy of the report.	I would like to offer the following comments in regard to the draft Floodplain Management Assessment (FPMA) report dated March 1995.	1. Additional detail should be added to Chapter 2 to clarify policy decision which were made regarding navigation and levee improvemtns. As an example, on page 2-8 in the last paragraph, the second sentence states, "By 1918, virtually no through traffic moved between St. Paul and St. Louis." An explanation of economic forces at work besides the lack of a "dependable navigation channel" would be helpful. It wouuuld appear that river shipping was uncompetitive and was then subsidized by the federal government at the states' request.
FROM			US Dept of Agriculture Natural Resources Conservation Service	•		Thomas J. Juen Glen Carbon, IL	

COMMENT OR GUESTION 2. Prior to issuing the final FPMA, a peer review of the document and its basis for findings should be performed by an independent group of engineers and planners such as a water resources agency from another country, for example Great Britain.	3. A moratorium should be placed on the raising of any agricultural levee which involves the use of federal government funds. This moratorium should continue until additional public discussion of the impacts of this policy is invited. The COE should be required to demonstrate that raising agricultural levees will not result in large expenditures of federal money for the improvement of urban flood protection works.	4. Additional and more detailed consideration should be given to nonstructural alternatives such as expanded state and federal parks located in upland areas. Perhaps these parks could be combined with "smaller" flood control reservoirs to provide cost effective protection.	These comments are made as a private citizen and do not represent the opinion of any specific organization or company. I believe the FPMA will be a valuable planning tool for professionals both within and outside of government. I appreciate the opportunity to provide input to this ongoing overall planning process. Some of these comments are general in nature but I believe their intent should be incorporated wherever possible into the final FPMA. To some extent, they reflect conversations I have had with other private taxpayers.	This letter provides the Upper Mississippi River Basin Association's comments on the Army Corps of Engineers' March 1995 draft Elocahlain Management Association's Comments of the Army Corps of	arrives somewhat after your May 12 comment deadline. Unfortunately, the review time provided was simply not adequate for each of our member states to develop its own position on the report and then for the five states to articulate their consensus thoughts. However, by virtue of the fact that the Association's comments are conceptual in nature, we believe they remain timely as you finalize your report and decision-makers in Congress and elsewhere begin to consider how it might best be utilized.	The states recognize that the Corps faced significant challenges in undertaking the FPMA. The Congressional directive was to "conduct comprehensive, system-wide studies to evaluate the flood control and floodplain management needs of the Upper Mississippi and Lower Missouri Rivers and their tributaries that were flooded in 1993." This directive was both broad and ambitious, while the time and money available to accomplish the work were quite limited. The systemic approach specified in the directive represents a departure from typical Corps studies, which are most often linked to evaluating individual projects.	The states are also keenly aware that the FPMA was a single agency study in which other federal and state agencies were observers, not partners. Nothing in the Congressional directive precluded the Corps' approach, and logistical constraints may have even demanded it. Yet it must also be recognized that a comprehensive floodplain management assessment for the Upper Mississippi and Lower Missouri Rivers and their major tributaries cannot be adequately accomplished by any single

COMMENT OR QUESTION agency CODE

Despite this fundamental disjuncture between FPMA's stated objectives and the process employed for undertaking the effort, the Association's member states believe that the assessment has made several valuable contributions. The report's strengths include the following:

- * The FPMA demonstrates the importance of systemic analysis. The draft report's findings regarding analysis is implicit in many of the Corps' specific technical findings, the draft report is not as effective measures must be considered in light of their cumulative systemic impacts. As elected officials and potential structural modifications illustrate that there are no easy solutions and that site-specific particularly important lesson to bear in mind. Unfortunately, while the importance of systemic river managers consider potential changes to individual components of that system, this is a as it could be in highlighting this cross-cutting conclusion for the non-technical reader.
- unsteady state hydraulic model for the region. While the Corps' work did not test the UNET model systemic analysis. State floodplain managers in the basin have long called for development of an Specifically, the FPMA illustrates the power of UNET modeling and digital mapping as tools for The assessment also served to demonstrate and advance technology in important areas. exhaustively, it did provide some good case studies on which further evaluation can build.
- By exploring a variety of "what if" questions, the Corps has attempted to provide insights into a range of structural and policy alternatives. The Association is not in a position to judge the technical merits of the analysis, more do the states necessarily agree entirely with the alternatives evaluated or the assessment of potentially viable alternatives is critical to good floodplain management decisions. conclusions drawn. However, the Association members do believe strongly that the sound
- significant precisely because they are somewhat counter intuitive. However, the FPMA fails to clarify that its findings with regard to the impacts of raising or lowering levees in the 1993 flood event would * The draft report also includes some specific findings that are useful in addressing public concerns floods. By explaining and publicizing its findings, the FPMA can make a valuable contribution to the policies..." Another significant insight is that levee modifications would not necessarily affect flood "approximately 80 percent of 1993 flood damages related to crops were not caused by overbank flooding and would not have been affected by any projects or changes in floodplain management continuing discussions surrounding the future of floodplain management on the Upper Mississippi setbacks may actually raise flood stages down stream. These types of findings are particularly likely differ dramatically if the modifications were modeled for more frequent, lesser magnitude stages in the manner one might expect. For example, the assessment concludes that levee and misconceptions regarding the 1993 flood. Of particular note is the Corps' finding that and Lower Missouri Rivers.

While the Association's member states are providing their technical comments to the Corps directly, there are some more general observations regarding the FPMA's limitations that the states wish to offer jointly: COMMENT OR QUESTION CODE FROM 9

- * The draft report falls short of being a floodplain management assessment. It is instead largely an policy options, there is a severe paucity of technical and analytical justification for these conclusions relative to that which is provided for the structural flood control findings. This is not surprising to the evaluation of selected flood control alternatives. While the report includes some findings regarding states, given that the assessment would have required a genuine partnership effort involving all disciplines relevant to floodplain management at the federal, state, and local levels.
- modeling and analysis to that single, unusual flood event. Although the 1993 flood was undeniably a * While the FPMA directive was to study the area that was flooded in 1993, the Corps chose to limit policy alternatives would have been far more useful if it included evaluation of these options under consider the greater frequency, lower stage floods. The Corps' analysis of various structural and major event with tremendous human consequences, it is not the only type of event upon which floodplain management decisions should be based. Policy makers and managers must also more routine flood conditions.
- on p. 9-40 include impacts of 2.7 feet at Quincy, Illinois and 2.9 feet at Hannibal, Missouri. In the view * In drafting the report, the Corps was not always as effective and accurate as it might have been in generally had a "minor to moderate impact on river levels" in the district. However, the figures cited conveying the meaning of its findings. As we have already noted, certain fundamental conclusions, potential for portions of it to be taken out of context, it is particularly important that the report be as judgments that are not justified. For example, the Rock Island District concludes that floodfighting moderate in the context of the 1993 flood. Given the high level of interest in the FPMA and the explicitly. In other instances, the language used to summarize quantitative findings introduced such as the importance of systemic analysis, are implicit in specific findings but are not stated of state floodplain managers, these impacts should be no means be described as minor or readable, clear, and accurate as possible.
- effective in regulating floodplain development than that they are consistent. The FPMA, however, did not evaluate which state and local programs, regulations, and approaches were most effective in the other important measures are all readily available and would have permitted the Corps to undertake levels of government need to optimize their approach to floodplain regulation. The absence of such * The draft report poses the question of whether there are inconsistencies among the states in their a more meaningful comparative analysis. This is the type of information that decision-makers at all administration of floodplain regulations. The states are troubled to the extent that this question and 1993 flood. Data on repetitive loss, compliance rates, community rating system participation, and perspective of the state floodplain managers, it is far more important that states and localities are the Corps' analysis of state programs imply that there is inherent virtue in consistency. From the analysis further demonstrates the need for collaborative interagency approaches to addressing floodplain management issues.

become another study that sits on the shelf. The Corps performed valuable analyses that should The member states of the Association believe strongly that the Corps' FPMA report should not

COMMENT OR OUESTION services of the control of the Association offers the following observations regarding next steps that might be taken:	* The draft report contains a great deal of valuable information, but it is not an optimal vehicle for conveying its most important findings and conclusions to a non-technical audience. In preparing to submit the report to Congress, the Corps may wish to consider an enhanced executive summary or a separately bound summary document. Such a document would be helpful not only to members of Congress and their staffs, but also to the wide range of others outside of the professional floodplain management community who are interested in the FPMA.	* While the FPMA lacked the partnership approach necessary to meaningfully assess the full range of issues associated with floodplain management, the state believe that the Corps; work can become a starting point for future multi-agency partnership. The report has certainly highlighted a number of issues that merit further consideration by federal, state, and local entities. For example, the Corps' work with UNET represents a good first step and should be used as basis for continuing dialogue and work among the states and the federal agencies on unsteady state modeling. Refining the model as well as resolving issues such as how and where it should be maintained will require a joint effort. It is possible that the Association's State Floodplain Management Work Group could serve as a means for facilitating some state/federal cooperative efforts.	* Because the FPMA was a single agency effort, the Corps may wish to consider taking special steps to communicate with its sister federal agencies. There are a number of findings as well as specific technical products that are quite relevant to the work of other agencies, such as the Federal Emergency Management Agency's mapping program. If the FPMA is simply forwarded to Congress, it will not have its broadest possible impact at the federal level.	A targeted outreach effort by the Corps' leadership to their counterparts in other federal agencies could go a long way in this regard

November Comment Spreadsheets

CONCERNS EXPRESSED IN NOVEMBER MEETINGS AND IN WRITTEN CORRESPONDENCE

NUMBER OF PEOPLE EXPRESSING CONCERN

Public Involvement - Key to Matrix Code

AALT - remove extreme action alternatives

AGR - agriculture benefited by levees; not enough about agriculture in this study; want regional versus national impacts in study; ag. subsidies; crops enhance wildlife; ag. protected as well as business; look at realistic ag. data - 5 to 10 yr. events; need ag. land in floodplain; rented land lost to the CORPS?; look at ag. practices in floodplain

BIOE - suggested use of nonstructural techniques by CORPS is one of best components of this study; use native vegetation in the watershed

BLD - build levees as HREP impoundments were done; lower road height; use water control structures to release water

BUF - buffer zone between waterways and tilled land; need buffer strip at least 60 ft.; better enforcement of buffer zone

CHF - levee channeling causes increase flow/volumes down river

CORP - well received at meeting; generally support study

CRIT - critical facilities considered priority; combine critical and priority sites; better explaination

DEV - encroachments in floodplain/river; embankments; 'hard surfaces' decreasing rainfall infiltration and increasing flood events?; construction of I-635 bridge caused increase flooding; took ag. land for development

DRE - dredged sand should be used on levees/ or completly removed; reduce dredging

ECON - cost/benefit to floodplain or land developed behind levees; benefits may not equal B/C ratio requirements (Do analyses favor those impacts that are easy to quantify and undervalue those that are difficult?); data does not allow complete analysis or by specific hydrologic setting; need higher estimates in modeling the impacts of watershed runoff reduction estimates; reduce FED. expenditures; need consistent funding; use a lottery system to raise capital; compare transportation cost of export grain shipped by barge; need better values placed on wetlands; difficult to measure dollars against acres

ENV - environmental values; impact of flooding on species; declining ecosystem; changes in aquatic ecosystem; water quality should be impact; consider the Draft Environmental Impact Statement for this study; include impact of flooding to wildlife; address culmulative effects to environment; more aggressive strategy to protect wildlife likely as shift seen in national policy

FE - look at using other flood events other than 1993 flood; impact of those on wetlands, tributary flooding and high water on uplands; flood control should be analysed

FER - flooding improves land fertility; promote cyclical flooding of agricultural lands

FF - oppose limited flood fighting

FLD - field studies in various land management practices on flood dynamics are needed in a variety of physiographic regions; comparison of standard project flood control levees along the UMRS.; need flood hazzard mapping

FP - floodplain; use of area for extreme flood events; lost storage capacity; move people out of the flood prone areas; need to study individual floodplain characteristics

Public Involvement - Key to Matrix Code

- FST fast and more financial response action post flooding
- HDW flood damage reduction strategies needed in the headwater and on the upland floodplains
- HIS historic preservation; sites protected; look at historical flood damages
- HO low cost housing outside of floodplain; housing location suggested in Galloway study
- HYD consider the hydraulic distribution of flood damages; specific hydrologic setting, such as the watershed scale or flood magnitude, better modeling studies needed like the Hydrologic Simulation Program for Fortran (HSPF); dams altered hydrology of mainstem rivers
- INS insurance rate costs; claim costs; crop ins. required residences too?;
 Gov't should not pay flood insurance
- LMS build levees as on the lower Mississippi; rebuild levees
- LVB- bad about 500-year levee; flooding behind; maintenance and improvement; private levees bad; use of 500-year seems excessive; don't build higher; interior drainage problem; why push back ag. levees but not urban levees?
- LVC levee, maintenance/improvement costs; study individual levee districts; clarify max. height; change slopes; keep levees low; either 500 yr. or NO levees; no segregation of urban/public levees
- LVG good about 500-year levee; value to navigation; set back from waterway; raize levees; maintain levees as is; need levees; repaired levees
- MM mismanagement by Feds, give to locals to manage; water control plan for Missouri River manual appears over influenced by Upper Mississippi executives and deters Lower Mississippi residents of their rights
- MTG public meetings good idea but response to format negative; use microphones for speakers and questions; too abstract; show slides that show work completed and make it more interesting to public; visual aids important!; no facts just PR at this session; interesting mtg.
- NAV impact of navigation projects, channeling, wing dams on flooding; value of nav.; expand nav. study to restore river dynamics; scenarios applied to nav.; consider long term impacts; determine the impact of cumulative effects from continued or increased navigation
- NS return rivers to there natural state (natural state not defined?);simulate natural geomorphological process
- OFC other flood control; other management than use of floodplains OMP strive for optimum management plan, use watershed management; CORPS experts so willing to work with them; CORPS should make all an inter-agency endeavor with USFWS, DNR, SCS, etc. as in other areas of country; need third party peer review; require a national balance of standard project flood protection to navigation, economic development, and environment and habitat protection; avoid agency self-interest multi-agency; Gov't work with communities
- PC more pollution control for river waterPOL policy defined through district or river mile, (same?)

Public Involvement - Key to Matrix Code

PPR - value of property in floodplain, private property rights; treat landowners fairly

REC - provide recreation, hunting, fishing, boating, etc.; consideration of ease of access by elderly, disabled, and non-boaters

REG - consistency in Gov't regulations; need uniform, standard, Federal policies; want Gov't. ownership of floodway

REM - remove structures from floodplain; buyout
RES - use water reservoirs; may invite criticism; Pick-Sloane plan; reservoirs
are proven to reduce flood damages;

RO/DR - stormwater run-off (urban and agricultural), use of upland measures, agricultural run-off problems; tailor to a variety of flood magnitudes; soil conservation and enrichment to prevent runoff and sedimentation buildup in rivers; address drainage problems

RR - reroute excess water to dryer areas
RVR - river wide policy, not separate for upper and lower; change river
management

SOC - social well being impact category; human value is not given enough importance; unclear what significance short and long term human trauma damages are caused by large flood events; human beings have a right to be protected; solution the same for everyone; equal representation; focus on social issues; moving out of floodplain

STDY - study, what will happen when it is completed? is it worth it? study nothing but public reaction placating, no confidence; need more time to collect data; study seems to cover too many issues/solutions; Will plan work? - too vague; don't misinterpret the data; potential benefit of study; very useful; HEC-1 modeling underestimates flood peak reduction; 3 scenarios - need better description; the three scenarios presented at the meeting raise some additional issues that must be studied as a comparison of floodplain management policy; need 4th scenario; very complex study- needs more funding

STRC - Corps should consider impacts of a maximum structural flood control approach versus the current bioengineering approach suggested

TRAN - water transportation important; address transportation impacts separately; determine future of Miss. river; increasing river traffic causes ecosystem decline (wind/wave action)

TRB -consider tributaries for importance, large amount of 1993 flood occurred in these areas, small watersheds

URB - urban protected areas; include/expand traffic corridors;

WET - value of wetlands, use as leased areas for water storage, habitat; largescale restoration of pothole wetlands; benefits of ground water recharge and flood control; increases water quality; include all wetlands; management of river ecosystem to floodplain is unclear

WL - water levels, need more capacity adjustment capabilities, clean out backwaters; change water levels in pool, make channels deeper, wider

WS - watershed management approach; need to take specific watersheds into account; future watershed study needed with a complete analysis of the distribution of cumulative historical flood damages within specific watersheds; storage capacity; integrate other studies; use of upland watershed reduction a plus; evaluate groundwater surface interactions; water supply

MEETINGS
GENERAL COMMENTS FROM NOVEMBER MEETINGS
NTS FROM
AL COMME
GENER

	FPMA Environmental	12/06/94	1000	DUDICATION OF COMMISSION
	Work Group Meeting		H	The concerns easing a feet in each District over the past few weeks, common concerns expressed: 1. Why aren't we looking at less extreme events for developing flood plain policy? This is related to a frequently heard
		*****	NA NA	concern that conclusions from our watershed modeling will suggest that wetland restoration has no flood reduction benefits.
		******	.	2. The title of title scenario, maximum Environmental Scenario", is misleading and/or confusing and should be changed. This scenario does not require that environmental issues be the deciding factor in flood plain development. Athorish
			Ç	it is being interpreted that way by non-environmental interests.
•			28	 Stell it water further the properties of the considered. An interesting observation from Omaha meetings was that some farmers want to see the levese set hack
7	Burlington Public Meeting	11/06/94	REC	More data should be compiled about the recreational use and value of flood plain land before 93 flood hunting,

)	2901 W. Truman Blvd.			the flood plain are critically important issues along our large rivers. We are hopeful this study effort will generate
	P.C. Box 100		*	recommendations that will correct some of the poor decisions made in the past in this regard. We believe the single

St. Louis Audubon Society James N. Holsen 419 E. Argonne Dr. Kirkwood, MO 63122	12/14/94	STDY STDY ENV ECON	Over believe the single most important stack relating to floodway loss and subsequent increase in flood heights is the Mississippi River below \$1. Louis. We are disappointed the study effort has not addressed this issue. In a January 1881 mississippi River below \$2. Louis. We are disappointed the study effort has not addressed this issue. In a January 1881 maintain during the channelization process. This means that the river localy, is on the average 1,500 to 2,000 feet narrower study, the Kansas CRy District CZE reported that ever 100,000 surface acres of the Missouri River had accreted to the below \$4. This underbuldy represents a tremendous loss in flood carrying capacity. We strongly recommend the FMA address these important issues. With recent advances in design of river stabilization carrying capacity and still maintain the commercial navigation channel. The Proposed Study Does Not Lead To An Opitium Management Plan. The first escenario (status quo, middle of the road, and maximum environmental) are rather arbitrarily chosen. There accounting, but without the quality of engineering gluggenest that is required to arrive at a solution that can be recommended to severe to be no attempt to define an optimum solution for flood plain management. The study promises to be an exercise in the nation as the best method for managing these river systems. The proposed Study Does Not Lead To An Opitium that is sessensment is designed to answer the precedence of the native standards of the native standards serve as a basis for the study. With each scenario, however, there are apparently many a very complex study which will into ideal to a simple answer or provide clear direction for future plans. The resources available for this study seem to be rather limited. I undestrand the fluid semilate to the study with will into ideal to a simple answer or provide clear direction for future plans. The resources available for this study seem to be rather limited. I undestrand the fluid semilation of a good flood plain manage
		\$ \$ \$	 ** Viviliation of Dollar-Values of Benefits and/or Losses Not Directly Expressible in Dollars. ** While the construction and restoration costs for the several scenarios are fairly easily evaluated in dollar values, it appears that the benefits to society will not be presented in dollar values so that they can be easily compared with the costs. In the reduction, government expenditure reduction, and increase in flood plain resources are all given in dollars. However, the environmental costs and benefits are given in numbers of acres or of sites impacted and, likewise, the reduction of risk is stated environmental costs and benefits are given in numbers of acres or of sites impacted and, likewise, the reduction of risk is stated in numbers of vulnerable facilities, people, or communities. ** The bottom line is the implementation cost, also given in dollars. The reader, perhaps a congressman, is left with the task of as threatened species and wildlife habitat, wettand and flood plain management, or open space values, will find it very difficult bound to be much controversy about the results. Nevertheless, it must be done by someone in order to make results in cost-benefit analysis and has the experts, or can call upon consultants, to advise on the environmental values. This would be a major undertaking. A Watershed Management Approach is Needed. A Watershed Management Approach is Needed. A Watershed Management Approach is required for a long term management plan for flood damage reduction on the Mississippi streams all contribute to flooding problems. In northern Missouri, for example, channelization of tributary rivers carries discussion of returning those rivers to a more natural state and that should be included in a complete study of flood plain management. Since the 1993 flood, these problems are more widely appreciated and there is greater demanagement.

Omaha District FPMA public meeting	17/09/94	ENV INS INS INS INS INS INS INS INS INS INS	management, not just the three actives considered in this study, it appears that the study itself, however, will have as a product an assessment of three actives senators and will not attempt to envise as it recommensation for an optimum 1933, the nation seems ready to by afferent approach. The placement of odilar values on the different options would be a valuable contribution. We hope that the study will five seless the qualifications must include an evaluation of the full obliar coasts of the three food damage reduction schemes. 		WET HIS REC FER	Is taken into consideration in roadway design.) IV. Some solutions to the problem that were offered were a dam on the Nemaha River (a major tributary of the Missouri River), leases of wetlands for habitat and water storage, and the Missouri River Corridor concept (restrict development to help preserve historic and cultural resources and provide recreation to attract tourists, as well as reduce damages). V. Effects of flooding. 1. An unexpected result of the sediment deposits on the fields: after 2-5 feet of sand was removed, the remaining sediment actually improved fertility in the flooded land, suggesting that fields should be let to flood every ten years or so, with help to remove sand from the surface. Data to support this might be obtained by comparing per-acre yields in the flooded areas before and after the flood, but hail storms, dry or very wet weather, or other events might obscure the data. (On the Platte
FPMA Public Meetings in LaCrosse, Wi	11/15/94	STDY STDY	Nover, which experienced spring neoding, the possibly enhanced fertility was overshadowed by the flood waters.) Key comments. For economic impact evaluation of ag levee alternatives are we going to recognize impact to developed areas behind those leves? (Sierra Club) The watershed analysis is of great interest and we must be careful to not misrepresent results by concentrating only on the 1993 flood and only on a bortion of the basin. Also, the 5% and 10% mindfreductions.

COMMENT OR QUESTION	The "Calloway' report did not adequately cover the area of agricultural subsidies and incentives. (Sierra Club) 'We should discuss how the runoff is reduced by upland measures. (John Flynn - attorney) 'I would be preferable to look at the long term costs of levees - not just at a single point in time since they are subject 'In response to a question on how many of the pre-1993 ag levees have been restored we guessed at a figure of 50-70%. 'In response to a question on how many of the pre-1993 ag levees have been restored we guessed at a figure of 50-70%. 'In response to a question what will happen to our report after it is completed and how will its conclusion be addressed in relationship to the "Galloway" report, we indicated that our report will be submitted to our headquarters office and Washington and be forwarded to Congress. The use of proposed reservoirs in the 1971 comprehensive basin study report as a basis for the additional reservoirs alternative is inviting criticism. (Sierra Club) 'John hathan (Sierra Club) requested a copy of the main report of the Corps 1993 post flood report. (request passed on to NCR or action)	1. CONTINEEN LOK CUES FION mages throughout the watershed. The elimination of natural water purification systems, such as wetla	d with an increase in fertilizer use, has increased the nutrient content of runoff conveyed downstre. This nutrient load has triggered a seasonal zone of anoxia, or "dead zone", in the Gulf. While the ad zone on commercial fisheries has not yet been quantified, scientists in the Miscleston, coasted	ited substantial environmental degradation. e of its involvement in the upper Mississippi Environmental Management Program and its responsi n and flood damage reduction, the Corps of Engineers is unique positioned to initiate a watershed-i	c restoration program for the Mississippi basin that will provide a wide range of environmental and e	sirty, reduced soil erosion, increased agricultural productivity, enhanced success of Environmental M restoration projects, and increased wildlife towards realization of these results. For your letter of September 19, 1994. The following is may reserve.	for the Flood Plain Management Assessment (FPMA). Know, the damages of the 1993 Mississippi River floods were distributed throughout the basin; not life	To the tiver and her major tributaries. Since the inception of the Corps' flood control mission, however lives to integrate flood damage reduction strategies on the uplands and in headwater areas with strate trivers and their flood control manage reductions are their flood control may be a supported to the control manage reducing the control management of the control management and the control management of the control management	this plant and food plains. The Corps has a unique opportunity in the flood plain management ass into uplant and flood plain strategies together, and to assist programs that provide upland treatment in sissippl subbasins that could most contribute to a basimwide reduction in flood demand.	mission, the design of the study structure is extremely important. The structure of this nortion of the modeling exercise in the FPMA. The structure of this nortion of the	ant in determining follow up actions for the present study, as you indicated when you said that "this a I pilot study to determine whether a much larger undertaking [such as a modelling effort for the entire.	and teasible. The modeling effort may determine whether further attempts to model the hydrology on taken, so I hope you will consider the following observations. First, many of the communities and farm	during the floods of 1993 were not on the mainstem of the Mississippi River or major tributaries. Rela If flood damages historically have been realized in upstream areas rather than on large flood plains. O	d damages appear to be rising fastest along small to medium sized tributary streams. Focusing flood strategies only on larger rivers, therefore, will not lead to prevention of a majority of the demans.	fore, to consider the local impacts of runoff reduction on lower order tributaries as well as runoff reducti Im on the higher order rivers, such as those included in the FPMA study area. We also anonimate and	long the course of the streams studied, and not just at their mouths. Concentrating only on the flood of 1993, even though the proposed study area does include 20 to 30	of Gutenberg, lows, misses the large proportion of flood damages that accrue in very small (two to three though the flood of 1993 was devastating, over time the majority of flood damage expenditures in this	itributable to more frequent events. It is possible that, by including very small tributaries in your study, ald be captured in an analysis of the 1993 flood. We urge you to include a study event that is	ossible flood conditions in your watershed modeling exercise.	that runoff from drainage areas downstream is not reduced proportionately, the results in terms of peak sippi and major tributaries will almost certainly be neglicible. This is because the month from our new one.	flood of 1993 was small in proportion to the total runoff from the entire basin; as one moves further from where runoff has been reduced, the impact of the reduction on the cumulative flood without is your same.	e "addition to the plan of study" indicates that "each subarea within the Minnesota River watershof will ecent conversations with Mr. Curtis Meeder in your office indicate that only a few subbasing within this	uded. If the intended products of this exercise are estimates of runoff reductions at the mouth of the K. Corps should construct the model to estimate reductions in runoff throughout the entire watershad.	the modeling exercise is to demonstrate the utility of runoff reduction techniques in reducing flood dan more appropriately done along the course of the stream and at the mouth of the subbasin where the course.	ian at the mouth of a major river receiving runoff from many other tributaries. The use of HEC-1 for this type of model is inappropriate. HEC-1 is a unit hydrograph model that accounts.	Initial conditions throughout the model run. The approach that you propose for application of the mode raph at the start of the model run and routing the modified hydrograph to the river's mouth.	of the attered hydrograph or track the factors that change the shape of the hydrograph, such as gradu wetlands, changes in infittration rates, or delayed flow of water in venetated.	water from wetlands, changes in infiltration rates, or delayed flow of water in vegetated swales. the use of HEC-1 as proposed is therefore likely to result in an underestimation of flood peak reduction. 	Public Meeting Attendee		PPR FP	like to do so we Everyone knows that we can't prevent flooding no matter how many levees are constructed. We can only minimize the impacts (economically, environmentally, socially, etc.). I believe that the more native vegetation that the minimize the impacts (economically, environmentally, socially, etc.). I believe that the more native vegetation that the watershed has (notice I didn't say flood plain), the less water that will reach the river. Trees, shrubs, grasses, etc. take up water and then transpire the moisture to the atmosphere. Thus the surface area available to evaporate water is increased. A severity of any particular flood. Severity of any particular flood. Secondly, we need to move people out of the frequently flooded areas and keep them out. Money is better spent on buy-outs rather than on payments to rebuild in flood prone areas. Finally, we must treat the homeowners and landowners fairly to help get them back on their feet, but we should not elevees. Thank win for the proporticities.
6	Upper Mississippi Flood Control Association	12/26/94	STDY TRB TRB COMP RO ECON	In the public meeting November 21 at Burlington lows scenarios of study were presented by the Corps for public comment that were proposed by the environmental inferest. In that public meeting, the Upper Mississippi Flood Control Association saked permission to submit a scenario of study for the flood plain assessment study. The following is the list of areas set added to the scenario of study for the flood plain assessment study. The following is the list of areas scenario distudy. Senario 4. The balance of flood protected and natural flooding areas in the present system is considered with national and environment and habitat protection. A comparison of a comprehensive system of Standard Project Flood Control Levees along the Mississippi, Missouri, and anvironment and habitat protection. A comparison of a comprehensive system of Standard Project Flood Control Levees along the Mississippi, Missouri, and protection. For comparison of ARP land and valued according to flood control Levees along the Mississippi, Missouri, and protection. Existing public use of watershed management practices to include slow release reservoirs on creeks and small streams with flood is. Lost Creek and Bryant Creek in Lincoln and Pike counties in Missouri. Existing public use of Levee Districts for funding, Edapping, mushrooming, and other recreation with consideration of Set and non-bact owners. Flood control benefits to wildlife habitat when compared to the large percentage of naturally flooding areas and loss of flood water and major river flood plains. Flood control benefits to wildlife habitat when compared to the large percentage of naturally assess and loss of any part produced in Levee Districts for unand adminage stream and expert grain produced in Levie of parties and unand relating systems accelerated run off of flood water and mitigation needed to offset and any produced in Levie of parties and relating and streams and relating systems accelerated run off of flood water and mitigation system and export grain produced
8	Southeastern lowa Mental Health Center, Inc.	10/29/94		The Burlington Area Flood Coalition of lows would like to respond to your request for input regarding afternatives for the Flood Plain Management Assessment of the Upper Mississippi and Lower Missouri Rivers and their tributaries.
				During and after the Flood of 1993, the agencies in our coalition responded to the disaster in Des Moines County lower. The following are concerns raised by our vast experience acquired over the last year and a half.
			오	Our most important concern is the availability of affordable housing. While many people are unable to find comparable housing elsewhere. Housing within the city is more costly. Affordable housing anywhere in the county can be difficult to find. At least one third of families impacted by flooding appearing at or below poverty level. Thus, any alternatives to evacuate or to increase potential for flooding must consider the impact to available and affordable housing in the affected area.
			ECON	A related problem is finding atternative employment for farmers whose income is adversely affected by flooding their farmland. Will surrounding towns be able to offer employment? For every dollar of farm income lost along the flood plain, an estimated four dollars is lost in the local economy. What will be the estimated financial loss and increase in unemployment to communities in the Midwest? Finally, will retaining opportunities be offered to those displaced due to removal of levees or other atternatives resulting in increased flooding?

We suggest that, in order to concentrate on the evaluation of feasible alternatives, the limitation of all federally constructed reservoirs, removal of all agricultural levees, and raising all levees to a 500-year level plus freeboard options be eliminated from the list of actions affecting hydrologic conditions (0.47 of the 2nd Milestone Package). These are extreme actions which few, if any, state/local governments would consider. If the intention of analyzing the limitation of existing structural flood control measures is to illustrate their positive affect on reducing 193 flood damages, we suggest a truer analysis. A true evaluation of the elimination of one structural measure cannot be done independently of the others. We suggest modeling flood plain conditions prior to federal dams, levees, channelization, induced accretion of land, and flood plain development.	We suggest either clarification of unification of the definition of critical sites and priority sites under the critical sites and priority sites under the critical facilities option (p.47 of the 2nd Milestone Package). If there is a benefit of breaking the definition of critical facilities into two parts and evaluating them separately, explain it and make the terminology on p. 47 and p. 52 consistent. If there is not a benefit to defining critical sites and priority sites separately, we suggest that there be a single definition of critical facilities.	We suggest clarification regarding the maximum height option (p.47 of the 2nd Milestone Package). While not stated, we assume this option refers exclusively to agricultural levees and, in addition to not lowering existing levees, would not raise existing levees to accommodate notching at the 25 year level.	suggest the evaluation of wetlands (p.51 of the 2nd Milestone Package) not be limited to non-forested lands, but include all wetlands, but include all wetlands as identified in the National Wetland Inventory.	While the need for complete and updated flood insurance rate maps (FIRM's) is addressed to varying degrees in scenarios two and three, we suggest that the need for accurate mapping of flood hazard areas is fundamental to the successful implementation of any flood plain management program and should be emphasized within the text of the final report.	fic, constructive suggestions will assist you in making the FPMA an important tool for deral, state, and local levels. We look forward to the results.	ments on the subject document. Because of the scheduling, I did not receive any input from r Region 7, and as I discussed, I will not be available for several weeks so did want to get affs will continue to review the document, and as appropriate, additional comments may be	I will also note that Region 5's representative to the Scientific Assessment and Strategy Team felt that some of the information regarding the data bases was not consistent with what is available from other Team resources and therefore, he provided copies of study documents to other members on the Team for information and possible coordination. I understand that any follow-up from these contacts will be sent directly to you, however, I will advise you of any that are received in Region 5.	Objectives. As noted in previous comments on the Plan of Study, Objective J, regarding cost-effectiveness is in reality dealing with benefit-costs of various proposals, in that there are no given objectives that are to be achieved, but rather the assessment, by its preliminary nature, is looking for cases where flood control measures, both structural and non-structural, when compared with the perceived benefits appear to warrant further pursuit. It would greatly enhance communication with the public, if the study documents would tacffully acknowledge that the Congressional resolution used the wrong nomenclature and thereby explain this in simple, more precise terms. For reference, Appendix A to 40 CFR 35, subpart E, is EPA's explanation of cost-effectiveness, and par 4.b is the primary definition. The bottom line is not to suggest that the Corps needs to define cost-effectiveness, but rather to arrive at an explanation that can be understood by the general public. What is presently provided on Page 3 is confusing and implies some undisclosed predetermined flood control standard.	Issues and Questions. While several of the stated issues skirt the social issues, none appear to focus on these aspects, but rather the predominant focus is economic aspects, i.e., material damages and assistance payments. How can this study include a focus on the social disruption caused by flooding?	A related aspect is the loss of human life, and to a lesser degree, injuries. (Scenario 3 on page 45 briefly introduces this topic, but does not pursue it either.) None of the issues address how loss of life can be controlled. Although I have seen several estimates and the ISMRC cites as advantages.

0	ECON set damages in major river flood plains. ECON - Compare transportation cost of export grain produced in levee Districts adjacent to the navigation system and export grain produced in Central lowa with consideration that 30% to 40% of the corn and soybeans that are produced in the Upper Mississippi Valley is exported through the East Gulf. STDY These requested areas of study are needed as a control or comparios to flood plain management policy and study as outlined in the other three scenarios. The study items in scenarios four is certainly not meant to state all of the term/riornment protection of a comprehensive system, but are intended to raise some of the issues that must be studied as a comparison of flood plain management. If study of the benefits and affects of a comprehensive system of flood control is not included the flood plain management assessment will be nothing more than an attempt to justify an arbitrary shift of policy.	TRAN	and beyond.
		American Rivers, Environmental Defense Fund, Friends of the Mississippi R., Izaak Walton League of America, Mississippi River Basin Alliance, Quad City Conservation Alliance, and Sierra Club	

In general, we believe the Corps must assess: "mechanisms by which the Corps can simulate the river's natural geomorphological processes, including the creation of new backwaters, chutes and sloughs, and manipulations of the river's hydrograph (e.g. drawing down reservoirs) that might enhance fish and wildlife habitat. "the cumulative environmental impacts of training structures and the potential benefits of modifying and removing training structures; and the effects of commercial navigation traffic on macroinvertebrates inhabiting rock structures; impediments to fish passage caused by the navigation dams and the potential benefits of retrofitting dams to aid fish passage; and, the long-term impacts and potential mechanisms to reduce the impacts of introduced species, including the zebra mussel; "the axtent to which flood plain development would be induced by increased navigation traffic; and the extent to which the flood plain restoration would mitigate for the impacts of impoundment; an endangered river	The Upper Mississippi River is home to 50 species of mammals, 45 species of reptiles and amphibians, 36 species of mussels, and 241 species of fish, including the most ancient lineage of freshwater fish in North America, and is the central flyway for 40 percent of North America's migratory waterfowd. The river has a natural beauty and rich, diverse history that attracts more than 12 million visitors each year — more than Yellowstone National Park — generating \$1.2 billion annually. But for more than a century, the Army Corps of Engineers has sacrificed the Mississippi's natural heritage to facilitate commercial navigation. In 1878, Congress authorized the Corps to develop and maintain a four-and-half foot deep navigation channel, and in 1907 authorized a six-foot channel to meet the needs of larger vessels with deeper drafts. The channel was developed by the construction of wingdams, closing dams and stabilized banks to constrict the flow of the river cutting of the construction of wingdams, closing dams and stabilized banks to constrict the flow of the view of the need of the construction of wingdams, closing dams and stabilized banks to constrict the flow of the view of the need of the construction of wingdams, closing the construction of wingdams.	In 1930, the channel was deepened to make the channels and backwater sloughs. In 1930, the channel was deepened to make the first and Congress authorized a system of 29 navigation locks and dams to further stabilize the river for navigation. Now, the biologist who monitor the health of the Mississippi River tell us that the construction of the locks and dams that make navigation on the Upper Mississippi River possible has set off a chain reaction that has placed the nation's great river on the verge of ecological collapse. Biologists point to declining populations of freshwater mussels and aquatic vegetation – key links in the Mississippi's complex food chain – and predict a long-term decline in fish and wildlife. A number of species are in danger of	sturgeon. Initially, the pools that were created by the construction of the locks and dams temporarily increased fish and widdlife. But the 1960s signaled the start of a long-term decline, as biologists and river users noticed a sharp drop in river productivity. The oxbows and meanders that once provided refuge from the river's currents, allowing fish and wildlife to feed and spawn, had been replaced by rock-lined banks. Those that remain are increasingly being filled with sediments from eroding farmland. The pools created by the locks and dams are becoming shallower as sediment that once passed downisteam to replanish the river's darks extract in the start manner.	Wind and wave action, as well as increasing river traffic, resuspend these sediments in the water, blocking sunlight needed for aquatic plants to grow and eliminating the "compacted" soils these plants need to take root. A group of river biologists recently warned that aquatic vegetation and insects – the base of the river's food chain – will soon disappear, and that waterfowl and fish will follow. "This sequence of events is inevitable whenever a river is impounded, and it is happening with increasing speed," on the Upper Mississippi River, said the Upper Mississippi River Conservation Committee, a 50-year-old coalition of federal and state biologists.	The "stairway" of navigable river pools created by the navigable river pools created by the navigation dams has greatly attered the hydrology of the mainstem of the river. Extensive areas of river flood plain were attered by the navigation dams, resulting in continuous inundation of areas that were formally seasonally-inundated. Over time, the once-complex topography of these areas has been modified by currents and wave action into a uniform substrate that offers little diversity of habitat.	Low rates of water exchanges in the impounded backwater areas has resulted in increased rates of sedimentation and, ultimately, conversion of shall-water habitat into wetland and flood plain habitat. The damming and channelization of the river has also prevented the river from carving new channels and hackwaters and has in time.

investments in the infrastructure of the Upper Mississippi River-Illinois Waterway System will extend the life of the lock and dam system. And, while a marginal increase in traffic may appear to have insignificant environmental impacts, marginal impacts become more significant in a system that is experiencing deteriorating conditions. In order to comply with NEPA, the Corps of Engineers must consider not only direct and indirect effects of an increase in navigation capacity, but must also address the cumulative effects of an increase in navigation capacity, but must also address the cumulative effects of this increase as well as the cumulative effects of ongoing operation of the lock and dam system until the year 2050 and beyond and other "reasonably foreseable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions." 40 C.F.R. Sec. 1508. 8 (effects include ecological, aesthetic, historical, cultural, economic, social or health impacts, whether direct, indirect or crmulative); 40 C.F.R. Sec. 1508.25(c) (EIS shall consider three types of which when viewed with other proposed actions have cumulatively significant impacts."). As a general matter, NEPA was enacted to ensure that Federal agencies take account of the environmental effects	of their major Federal actions by preparing, in advance of a decision, an EIS that sets forth in detail all environmental effects are environmental effects are considered before a decision is made. CEQ Regulations, 40 C.F.R. Sec. 1500.1(b) ("NEPA procedures must ensure that environmental information is available to public officials and citizens before decisions are made and before actions are take"). This is true of all impacts of an action, including cumulative impacts. CEQ's regulations have defined cumulative	impact as the impact on the environment which results from incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. 40 C.F.R. S. 1508.7. The courts have consistently held that cumulative impacts are among the environmental effects that must be considered in advance of an agency decision. E.G City of Tenakee Springs v. Clouch, 915 F.24 1208, 1312, other	Cir. 1990) ("NEPA requires consideration of the potential [cumulative] impact of an action before the action takes place."); Sierra Club v. Penfold, 857 F.2d 1307, 1321 (9th Cir. 1988) ("NEPA requires that where several actions have a cumulative or synergistic environmental effect, this consequence must be considered in an EIS."). EPA's Section 404(b) Guidelines, which govern the issuance of dredge and fill permits under the Clean Water Act, provide a quite explicit statement of what must be done by an agency with respect to cumulative impacts before issuing a permit that will affect river resources: Cumulative impacts are the changes in an aquatic ecosystem	unst are attributable to the collective effect of a number of individual discharges The cumulative effect of numerous such piecemeal changes can result in a major impairment of the water resource and interfere with the productivity and water quality of existing aquatic ecosystems. Cumulative effects attributable to the discharge of dredge of fill material in waters of the United States should be predicts to the extent reasonable and practical This information should be documented and considered during the decision-making process concerning the evaluation of individual permit applications.	Waterway System, this study is, for all practical purposes, deciding the future of the Upper Mississippi-Illinois (Waterway System, this study is, for all practical purposes, deciding the future of the Upper Mississippi River until Mississippi River-Illinois Waterway System for the years 2000-2050 and will, by its very nature, extend the life of Under CEQ regulations, the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," to the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system is "connected," the decision to expand the navination system	system for an extensive period. (40 C-R. Sec. 1508.25 requires that the scope of an EIS consider "connected actions." "Actions are connected," among other reasons. "If they are interdependent parts of a larger action and depend on the larger action for their justification." In this case, the economic analysis of expansion is dependent on the maintenance and rebuilding of the existing system and is therefore a connected action).	I he courts have repeatedly enforced this regulation. They have repeatedly enforced this regulation. They have repeatedly found that an agency that makes an "inetrievable" commitment of resources that will then heavity findence a subsequent action, the environmental effects of that subsequent action must be analyzed at the time of the first. For example, in Don't Abrois, Doney will be a first of the first
NAV							

action. The court held that it did constitute a major federal action because it "sets the stage" for the initiation of a new hydropower program. See also Environmental Defense Fund v. Andrus, 596 F.2d 848 (9th Cir. 1979).	Nor can there be any doubt that a decision to maintain and rebuild the existing navigation system is an action that requires an EIS to examine the full range of environmental issues associated with that system. In Confederated Tribes and Banks v. F.E.R.C., 746 F.2d 466 (9th Cir. 1984), FERC claimed that it did not need to prepare an EIS before relicensing an existing dam because doing so would cause no new environmental effects. But the court held that maintaining the dam for an additional period constituted a new action with significant environmental effects.	Without doubt, the ongoing maintenance of the lock and dam system will exacerbate what river biologists have called "aging reservoir syndrome," the long-term biological decline associated with the impoundment of river systems. Biologists warn that impoundment will lead to the loss of aquatic vegetation and insects — the base of the river's flood chain — and that waterfowl and fish will follow, a sequence of events that is inevitable whenever a river is impounded.	The well-documented ecological collapse of the Illinois River provides a dramatic example of the effects of impoundment. Sediments that were already being delivered at faster rates due to farming practices remained in the system longer after the damming and channelization of the Illinois and were more easily and frequently resuspended, blocking the light needed for aquatic vegetation. Wind and wave activity increased, finishing off the last remaining flood plain trees, leading to increased erosion and turbidity. Ultimately, increased turbidity and the absence of a period of low flow, eliminated aquatic plants and insects, leading to a system-wide ecological collapse (See R. Sparks, Malding Predictions that Change the Future: Forecasts and Alternative Visions for the Illinois River, Illinois Natural History Survey, 1994.)	Like the illinois, the Upper Mississippi River is undergoing a similarly dramatic transformation. Backwater areas have begun to fill in with sediments and convert from a system dominated by emergent aquatic plants to one dominated by algae, and other key biological indicators — mussel populations, for example — suggest that the system is on the verge of a similar ecological collapse. By reinvesting the lock and dam system without assessing and mitigating for the long-term ecological effects of ongoing impoundment, the Corps is ensuring that the Upper Mississippi River will follow the same course as the lillinois.	riate Baseline.	The Corps violates NEPA by defining the baseline as existing conditions instead of pre-project conditions. For all practical purposes, a capital investment in the lock and dam system is not the "mere continuation of the status quo", but rather a "new irreversible and irretrievable commitment of public resource." Confederated Tribes and Bands of Yakima Indian Nation v. FERC, 746 F.2d at 476. (The decision to relicense is to be based on the same inquiry as the original licensing, including a consideration of all relevant harms and benefits to public uses related to the project). By simply measuring the impacts of additional navigation traffic on an already degraded river system, the Corps is assuring that environmental impacts will appear minimal when compared the economic costs associated with barge delays.	In comments on an issue similar to the navigation study, EPA recommended that the EIS evaluate the total impact of the project, not merely the impacts from the proposed modifications or operation changes. For purposes of measuring the impacts, the baseline for the environmental analysis should be the conditions that existed pre-project, before the construction of the facilities. This baseline of pre-project conditions should also be used as the basis of the without-project alternative analysis. EPA scoping comments, 11/23/92). EPA also suggested that the Corps recognize that the "no action alternative" in its review of the Missouri River Master Water Control Manual is not a "no impact alternative" and said the Corps "must take into consideration the past and continuing adverse environmental impacts that the current operating scenario had had." EPA comments on PDEIS, 8/4/93, at 4.	A pre-project baseline is the only appropriate benchmark for determining what steps the Corps must take to restore and give equal consideration to the natural resources affected by the existing project, and provides the basis for evaluating the continuing impacts of the lock and dam system. A pre-project

Increase in avigation capacity, but the option of providing enhanced protection for the increase in navigation capacity, but the option of providing enhanced protection for the ippi River. Corps must consider the effects that impoundment and river regulation have on sediment to quality, vegetation, and fish and wildlife habitat, and assess changes in river regulation river regulation river bydrologic and habitat conditions, including draw downs and changing control points. The considers a full range of alternatives, it will fail to comply with NEPA. st expand the scope of the navigation study to assess cumulative impacts. the river's natural hydrologic and sediment processes may be the surest and least costly an ecologically viable river system and continue to support commercial uses of the river. In it assess the effects of ongoing operation and maintenance of the lock and dam system, at assess the effects that impoundment and river regulation have on sediment processes, regetation, and fish and wildlife habitat and must assesses changes in river regulation that hydrologic and habitat conditions, including draw downs and changing control points.	urposes as well, the Corps should assess least costs alternatives that maintain the grity of the Upper Mississippi River system. Although the environmental restoration rized by the Water Resources Development Act of 1986 has produced numerous projects local environmental benefits, these projects are costly and fail to address the long-term river's natural processes. Solutions that restore the river's dynamic hydrologic and isses may more cost-effectively offset the impacts of existing or increased levels of traffic.	To reiterate, the Corps must assess: * mechanisms by which the Corps can simulate the river's natural geomorphological processes, including the creation of new backwaters, chutes and sloughs, and the manipulations of the river's hydrograph (e.g. drawing down reservoirs) that might enhance fish and wildlife habitat. * the cumulative environmental impacts of training structures and the potential benefits of modifying and removing structures; and the effect of commercial navigation traffic on mactroinvertebrates
NEPA regulations and federal caselaw make clear that the Corps must therefore consider not only the impacts of an increase in navigation capacity, but the option of providing enhanced protection for the	tion tion tion tion tion tion tion tion	

COMMENT OR QUESTION	dams to aid fish passage; and the long-term impacts and potential mechanism to reduce the impacts of including the zebra mussel; the cumulative effects of channel maintenance dredging and material placement; and the environmental impacts of channel maintenance dredging and material placement; and the environmental impacts of resuspension of contaminated sediments; the extent to which flood plain development would be induced by increased navigation traffic; and the extent to which the flood plain restoration would mitigate for the impacts of impoundments;	NEPA's implementing regulations specifically require that the EIS for the Upper MississippI-Illinols Waterway Navigation Study — "Include reasonable alternatives not within the jurisdiction of the lead agency." 40 C.F.R. Sec. 1502.14(c). CEQ guidance explains that "an alternative that is outside the legal jurisdiction of the lead agency must still be analyzed if it is reasonable." CEQ Memorandum: Questions and Answers About the NEPA regulations, 46 Fed. Reg. 18026 (March 23, 1981), as amended Fed. Reg.	Federal appeals courts have required agencies to consider reasonable afternatives beyond their jurisdiction. See, e.g., Natural Resources Defense Council v. U.S. EPA, 822 F.sd 104, 128 (D.C. Cir. 1987) (agency "[took] nde of its obligation to action, regardless of whether the agency has the power to implement those alternatives.") The same appeals court agreed earlier that the spirit of the NEPA requires an analysis of atternatives which goes beyond the bounds of the lead agency's jurisdiction.	NEPA requires an integrated view of the environmental damage that may be caused by a situation, broadly considered, and its purpose is not to be frustrated by an approach that would defeat a comprehensive and integrated a consideration by reason of the fact that particular officers and agencies have particular occasions for an limits on their exercise of jurisdiction." Henry v. FPC, 513 F.2d 395, 406 (D.C. Cir. 1975) (where federal agency has jurisdiction over decision that would help trigger larger project, agency must analyze impact of larger project, agency must consider impacts of alternatives only Congress and President have authority to implement); National Wildlife Federal v. Marsh F. Supp. 985, 990-991 (D.D.C. 1933) (Department of Army considers 19 alternative sites for facility for which applicant had identified its preferred location).	Failure to evaluate reasonable alternatives merely because they cannot be directly implemented by the lead agency or the applicant squarely contradicts the goals of the Act. At least one other circuit has concurred with this view is a decision that directly involved the Corps. See Van Abbema v. Fornell, 807 F.2d 633, 638 (7th Cir. 1986) (Army Corps of Engineers must explore fully alternatives beyond its	In the next five years, decisions will be made by the Corps of Engineers that will either ensure the destruction of the nation's great river or will instead begin to reverse more than a century of short-sighted ecological decline. As currently designed, the Upper Mississippi-Illinois Waterway Navigation Study will fail to balance the needs of ecology and commerce. Rather than attempt to measure the consequences of ongoing operation and maintenance of the lock and dam system, the Corps has instead designed a	After a detay in obtaining the data necessary to evaluate the initial fifteen sites selected in Phase I of our Mississippi River Wetland Restoration Project, we have now reduced the number of sites to six. The sites, selected for Phase III of our study, provide an exciting opportunity to demonstrate the potential to reduce flood damages by restoring wetlands in the Upper Mississippi River Basin. The six sites, and the process we used to evaluate and rank them, are described in the enclosed report.	We are impressed by the number of restoration projects that are going on in the region, especially along the Missouri and lowa rivers, and in the Minnesota River basin. Unfortunately, most of them will not significantly reduce flood damages, either because they already flood on a regular basis or they are not located near a flood damage area. There is great potential for wetlands restoration along other rivers that warrant additional consideration, but our time and budget do not allow us to pursue these projects now.	We especially want to acknowledge the staffs of the state and regional offices of the U.S. Fish and Wildlife Service and the state offices of the U.S. Soil Conservation Service for their help in identifying potential restoration projects and obtaining information on the projects located in their states. We also want to thank the Rock Island District of the Corps of Engineers for providing access to their GIS data base on levee breaks in the basin during the 1993 flood, which aided our evaluation.

ш	NAV Please accept this letter as an indication of my support for flood control and navigation requirements for the Missouri River. If this were a ballot, it is intended to be cast for the human race composed of tax payers instead of the pallid sturgeon.	AGR I suppose I am wasting my time pleading with you to please give the land owners some consideration.	Not so long ago I was offered \$2500.00 an acre for my farm. Also I was asked just to name my price a few weeks before the '93 flood.	Does this sound like a farm to be put in wetland?	This farm has been in my family four generations and I couldn't part with it.	Due to the levee you put across my farm, leaving so much of it on the outside of the levee, taking my pecan trees, destroying part of the irrigation system (the government said our city had to have for their lagoon disposal) my farm has declined in value. So much of this was uncalled for except you want to make good farms into wetlands for wild life and fish.	Please give all this some thought! What about the farms that furnished your food? AGR Haste makes wastel" Please don't inundate this richest farming soil of the Missouri Valley on a whim	Agriculture is not only the livelihood of our farmers and the many, many others who work and depend on ag products it is the one thing there is no more of on this earth – LAND!	Turning this productive farmland into possible tourist attractions, or making it into a fish and wildlife area doesn't make sense.	Please consider: AGRICULTURE STILL IS THE BACKBONE OF OUR COUNTRY!

FLOOD PLAIN MANAGEMENT ANALYSIS COMMENTS AND QUESTIONS RECEIVED FROM JUNE MEETINGS

	Fuits, Illinois	Agriculture	liked and farmed in this area for all my life, I am 68 years old. I raised a family of 4 boys putting them through college. We farm approximately 1200 acres in this vicinity. I own 400 acres. Maintaining all of this by proper farming methods. I do not wish to see this destroyed by some silly klears. I experienced 4 flood were. We see that
* *	Kansas City, Missouri	Agriculture	In full operation since the 1993 flood. Keep our levees in good condition and we'll take it from there. The Corps of Engineers and any other planning group must be very careful when flood plain management is being considered. Not only should wild life be preserved and encouraged but also our farmers. The very best and most fertile land is in the bottoms with the most flooding being produced there. At the present time, we have surplus but we must think of the future. The farmer must not be short-changed in this plan. Please let him be heard! Without
	Hartsburg, Missouri	Agriculture	Nearly everything that is being discussed at our meetings are directly affecting the farmer, yet there is no farmer of farm organization that has had a chance to protect their interests. You're affecting the lives of a lot of people yet your ideas are so started toward fish and wildlife it makes me wonder who has priority, fish or people! The Corps has made a lot of progress by channeling the river. Now you're heading back to the "horse & buggy days" when you had sandbars in the middle of the river and this is all happening because we've had a 1 in 500 years flood. I think the whole thing is strictly
	Kansas City, Missouri	Agriculture	The corps should weight the economic impacts to people (i.e. crops, homes, etc.) more heavily than the environmentalists and recreation groups. Raising the MO river level 4 ft. would cause billions of dollars lost in the economy. Response and coordination is very important. I've had an application in for 1.5 years without any conclusions (A 404 permit to create a drainage dich to the MO river). Too much bureaucracy will limit effectiveness and cost too much hother taxwavers.
	Hermann, Missourl	Agriculture, Other Industry, Env. Interests	There needs to be some reservoire or holding areas built on rivers empting in the Missouri. With more and more land put under concrete, we need to slow the run-off down, and at the same time save water and silt, also the MO River banks are filling. Since 1973, the bank on the north side of the river at Hermann has gone up 8 ft Also the liftes that go completely across river need to be kooked into. Also the dikes we feel need to be rain at start, so as the river has a wider channel. Bus channel and some some latter to be some latter or some start.
	Columbia, Missouri	Agricutture, Mental Heatth	My clients say put levees back to pre-flood levels. Then decide what needs to be done. People and wider channel. If & Question set of me to find the first to return levees to pre-flood status? Earthquake and hurricane wind ma as not relocated it please and hurricane.
	Columbia, Missouri	Agriculture, Mental Health	Please send me a copy of Draft Economic Work Groups Report. It would be very helpful for my constituency to review. Tranks!
	Red Bud, Illinois	Agriculture, Self	I grew up on a farm in the flood plain near Futto, IL, and presently work for an agricultural supply and grain marketing Co-op. The lives and livelihoods of many tax-paying farmers and the people they do business with (the Co-op I work for, other ag suppliers, their employees, achools, churches, etc.) are impacted by continued use of this area, which hasn't flooded since before the present levee system was built in the early 1950's. Drastic measures such as reducing protection, which some are advocating, might serve a specific purpose of theirs, but would adversely affect food production, the economy and employment in the area, and the diverse wildlife already inhabiting the area. The risks of using this protected area have historically been far lower than the hurricane-prone guif coast or the earthquake/fire area of California, yet these places remain heavily populated. Adequate protection for the bottoms in Monroe and Randolph County, Illinois and other areas like this, such as the McBride, Missouri bottom, to name just one certainly seems to make the manual streams.
	St. Peters, Missouri	Other Industry	I am concerned that the Environmental Work Groups is only focused on preserving flora and fauna and not about
	Waterloo, Illinois	Agriculture	The 1 to 4 session was very productive as everyone was able to hear questions and the answers given. The 6 to 8 session had everyone standing around in individual groups and most people left because no one had any idea what was going on. Seems they had too many hard to answer questions and the because no one had any idea what
iiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiii	Fults, Illinois	Agriculture, Self	We don't want to be made into a wetland. We don't need so much studying, what we need is our levee repaired and not so many agencies telling us how to take care of our lives. There has been people living in the river bottoms for

	333331		cost 8 million dollars to repair our levee that was cost effective. If the 8 million dollars had been used to repair the
;			EVEC II Would have been a lot less costly than the flood damage. This would have been for a 100 year levee.
2 5	Ked Bud, Illinois	St. Govt, Planning	The Pat District manages extensive resources within wetlands along the Kaskaskia Navigation Project.
2			Any plans developed for groundwater control should use voluntary Best Management practices and given adequate time to work. These practices take time to show results. Product removal should be a "last resort measure" used only in extreme cases. The cost/benefit analysis should be applied to this problem at an early date in the study. A method for challenging the findings should be readily and inexpensively available to all parties. While protecting our groundwater is of utmost importance to all of us as rural residents. This must be tempered by good common sense
			and moderated to something that can be documented and pose a real (not imaginary) threat to public safety and health.
*	Valmeyer, Illinois	Agriculture	The flood of '93 probably was a hard leason on the power of Mother Nature. Building reservoirs north of St. Louis would greatly reduce the possibility of this disaster ever happening in the future. The emotional, physical and financial hardship that this has caused far outweigh any environmental concerns. With open minds, the result could be a MINAMIN attriction for hat the force and the possibility of the p
र्ट	Fuffs, Illinois	Self	The Mississipp River's main focus should continue to be barge traffic and the use of the flood plains should continue to be for agriculture and related purposes. The levee system should be upgraded and all levees should be brought under the Corps' jurisdiction, so that the upper Mississipp has one continuous integrated levee system like that in place on the Miss. south of Caliro. Flood runoff management needs to begin in the uplands. By the time the water reaches the river bottoms, it is too late to effectively manage the volume. The rivers and flood plains midwest are too valuable to be left unused. The present uses work and should not be discontinued because of an occasional flood
91	Waterloo, Illinoie	County Gov't	I believe the upper Mississippi basin should continue to be used for agriculture and residences. The principal focus of the river itself should remain navigation. The river and its bottom lands are too valuable a resource to be left unused or used for recreation only. It is my understanding based of FEMA data that 50% of the damages paid out during the flood of "93" were for upland crop damages caused by the heavy rains. To use inflated figures to justify changes in the use of our river resources does not help anyone. I firmly feel, based on our county's experience in the 93 flood, that what needs reviewing is not our nation's use of the flood plains and rivers. Rather, we need to concentrate on reviewing our response to the occasional flooding which occurs.
17	Sparta, Illinois	Agriculture	I don't think that we can afford to think of abandoning our levee system and all its benefits to our people and our economic system. The loss of business tax moneys people and business would be devastation to our community.
18	Kirkwood, Missouri	Env. Interests	The St. Louis Audubon Society advocates a greater reliance on non-structure techniques of flood plains management, including buy-outs and restoration of open spaces and wet lands. Non-agricultural development on flood plains should be restricted. A single federal agency should have responsibility for coordinating all aspects of river management and for the preparation of a plan for restoring the Missouri and Mississippi River ecosystems. The coordinating agency should seek the cooperation of non-governmental organizations in preparing the restoration plan.
6	Columbia, Illinois	Agriculture, Env. Interests	This study is being done because of one (1) five-hundred year flood. At one time several thousand years ago, the river was bluff to bluff but there were less people too. If the levees are taken away, the rivers will flood the earth, maybe every year, maybe every ten years killing everything. If the levees are built and maintained at wo foot freeboards, homes, animals, plants, railroads, highways, will be protected. A closer cooperation between the Corps of Engineers and local levee districts is a must.
20	Washington, Missouri	Agriculture, Private Property	Wetlands are a waste of government money which will come from hardworking citizens anyway. Only the working class will suffer the consequences. The government now already has too much land under control and the individual is just being pushed out. Such things as private property and easements mean absolutely nothing. I've had private property and easements are not even worth the paper they are written on. A 500 year flood does not make it grounds for wetlands. That is not even common sense. The only one that make this to their own good is big business and money, not poor people and farmers or private property owners. Private property should be a #1 issue. This country is getting worse and harder to live in just because of too many rules and regulations. Farmers need protections and not being forced out
2	Waterloo, Missouri	Agriculture	Our farm partnership feels strongly that farmland in the Monroe County bottoms area should be protected as it was prior to the 1993 flood. Our farm has been in our family for many years and has provided income and jobs. Our farm, though small in acres, is very fertile and produced outstanding yields. We would like to urge the government to return the levees to their pre-flood height.

2	Perrolle Mercia		CODE COMMENT OR QUESTION
1	UNING WIREOUT	Agriculture, County Gov't	Levee systems should be left in tact and should be raised to provide extra protection from excessive run-off. Because of the fast run-off from concrete and new drainage systems and more and more hard surfaces such as asphalt and concrete being ach year. The whole picture needs to be kooked at instead of saying river levels high because of levees. In 1993 quite a number of levee systems had falled leaving river from bluff to bluff and the water levels keep going higher. Levee's could be raised by dredging the rivers out and putting dredge material on land aide of

	nesson e		environmental reasons. (The same goes for leasing out Army Corps land.) With respect to levees and wetland restoration.) I hope the assessment will model the impact of under destoration.
			downstream—generally to treat the rivers and plains as a large hydraulic system. Force (re)construction should not proceed without such studies. Finally, I am not adverse to special provisions allowing agricultural use of rich
27	Graffon, Illinois	Self	Import of the Nutwood levee, and the effects of levees above and below Graffon, on the water level during floods at
28	Bethalto, Illinols	Env. Interests	I would like a copy of the Galloway report. I favor return of offen flooded agricuttural land to their natural state. I
58	Barnhart, Missouri	Seif	tinink levees are part of the problem not the solution. Most urban levees should not be rebuilt or enlarged. Levees in Illinois south of St. Louis along the Mississippi River have contributed to severe flooding accompanied by tragic suffering and financial losses to the victims on the Missouri side. During the flood of '93, our friends on the Illinois side suffered frightful losses and the area suffered ecological disaster. I hope that past mistakes will not be repeated by attempting toshould be treated fairly through
8	Pevely, Missouri	Self	waste, and impose further tragedy upon its citizens. I think they are very unsightly sight, they such make them better looking and we'll never mind they such! They cost to much money to build there a waste of time if someone want to live in a flood zone screw them. It's their fault they moved next to them not mine. So move the dumb things.
5	Bamhart, Missouri	Agriculture, Self	I would like to see the levees gone. Let the rivers run their natural courses, without being bottled up. I as a taxpayer am tired of buying people out time and again because they are too stupid to realize that the river is at their back doors when they buy. It amazes me to think that you people need our comments when you have engineers being paid to tell you the levees need to go. My tax dollars, I am sure, are going for these forms and their processing! Why pay engineers, wildlife specialists and the like when you can ask the public and of it cheaper. Use your heads instead of my wallet.
32	Fleidon, Illinois	Agriculture, Project Recovery	1. Dredging the rivers and using the material to elevate and strengthen the levees would be of great benefit. 2. The evided areas are taxed as prime property, the counties would lose a huge revenue without this property being within a levee system. 3. Our levee was built in 1910. It has worked for 83 years, with only one failure in 1993. Excellent a verage. 4. Sall conditions were excellent in over-flow areas where there was not a sediment of sand. Sall was extremely mellow and crops went in with minimum till-no apparent surface compaction. 5. This is not from personal experience, but there were many comments regarding the personnel sent out by Corps not being knowledgeable about a situation this serious. Many contradictory statements, by Corps personnel, were made adding to the confusion. Corps representatives need to be better informed and trained. In working with Project Recovery, the outreach workers, FEMA employees, etc. would like to see the inequities addressed for future disasters. It appeared that carelessness and extravagance were rewarded. The responsible, hard-working people were penalized in regard to the grants.
33	Fieldon, Illinols	Agriculture	The Illinois River has changed. There's more sediment in the river which has reduced the passage.
Z.	Godfrey, Illinole		1. Hartwell levee repair. 2. Greene County ordinance regulation development in special flood hazard areas, provides for permits and variances, FEMA had no permits or variances. Why not? Upper Mississippi River committee- fit into overseeing picture? FEMA innisdiction? When and how love.
32	LaCrosse, Wisconsin	Sec	Existing flood control structures did not prevent severe damage during the flood of '93, and we are opposed to increasing structural control in the hope of avoiding a repeat of such a catastrophe. Wetlands along the Mississippi need to be restored, farming discouraged and building prohibited. If possible, individuals and communities should be tailed to move out of the flood plain.
36	Eau Claire, Wisconsin	Env. Interests	The studies proposed seem to be very desirable and address some of the major issues. It is encouraging to see the Corps take this extensive introspection and I appreciate it. Some specific concerns: integration and coordination of existing structures on the river itself and tributaries. To what extent is it possible to coordinate the structures now functioning on tributary systems and operated mainly for power and recreation impoundment use to mitigate peak discharges during floods or potential flood periods? I.E. timing discharges to prevent all release from peaking at critical areas at the same time? Do all of the agencies and other entities involved, state DNR, FERC, etc. have a communications net capable of coordinated action? Prevention of runoff from agricultural and urban areas. What age practices can best prevent major fluctuations in surface waters in the basin? While wetlands may fill and in

CODE COMMENT OR QUESTION	a role for wetlands and filter stripe in regulating the intensity of flow regardless of unusual rain patterns? Can current storm water runoif practices in urban areas be changed to significantly lower their impact on flooding-settling basins, diversion of rain gutter outflows from divieways, streets, to vegetated areas? Can flooding-settling basins, diversion of rain gutter outflows from divieways, streets, to vegetated areas? Can for flood plains? Can the natural deposit of nutrient rich sediments now excluded by levees actually benefit agriculture rather than current situation of concentrating such sediments in existing backwaters of natural areas and wildlife refuges where they contribute to and accelerate eutrophication? Navigation issues. This is another area probably best addressed in another major Corps study where environmental groups have some interest and major concerns too complex to detail here. Effect of recreational use of river on flooding. What is effect of channeling the river and tributaries for providing stable channels deep enough for larger and larger recreational traffic (mainty on tributaries) with such practices as wing dams and rip raping shore lines. Everyone wants the rivers to go where they want rather than where flood plain rivers naturally go. Isn't a major flood one of the river's answer to this constraint? To what extent does use of large and fast recreational boats on flooded backwaters not normally open to recreation contribute to major erosion, destruction of levees, etc.? Industrial and development along the river. Many of the major issues here seem to addressed in the study from a point of view of effect of construction on flooding, since both types of development seem to depend on set channels which are often created by techniques that and entered to be located along the river? Can industrial construction move back a little and give the river a little room to be a river.	The project should clearly identify areas of repetitive flood damage, using flood insurance and crop insurance claims.	The slide presentation at LaCrosse did not clarify that the locks/dams on the Upper Mississippi are not intended to control flooding, but seemed to assume COE is currently embarked on restraint of flooding in any exigency. As a taxpayer, I resist continued security for flood plain development by anyone, then calling on COE and ME to ball them out (Pammel Creek, LaCrosse). Please tell me what it means: item #3 under general objectives: Thow the array of land and water resources could be used to provide varying outputs from alternative uses of flood plain resources." Good grief! The resource of flood plain is to refrain from using it if at all possible, and leave it for flood water storage and wildlife.	Seem to be a good beginning.		I believe the levees in the Sny Island Levee Drainage District (110,000 acres) located in Adams, Pikes and counties of Illinois need to be raised and maintained to at least the subjected 500 year flood level. The Drainage District had never been flooded until 1993 when the northern portion of the District consisting of 44,000 acres and the town of Hulf, Ill, were flooded. The water level at the of the levee break has been calculated to have been at or above the 500 year level. With the relatively simple construction of a higher levee, we can prevent another flood for 5 centuries! I believe the economic study of this area will also show that Pike County, Ill the income and taxes from this 100,000 acres, not another government level acre to maintain.	The Corps' Flood plain Management Assessment should include discussion on the impacts of flooding on highways. Questions to be addresses: 1. Is the bridge too small and road grade too high thus creating excess backwater and significant economic damage upstream. Also, when the road grade is too high, the flood has no "relief valve" for extreme events (e.g. Q500) which could result in increased velocities and scour through the bridge opening. 2. Is the road too low forcing frequent over-topping and road closure, thus impacting emergency vehicle needs and the transportation of goods, and also increasing safety problems for vehicles (e.g. people driving through flooded roads and being injured or killed). Issues involved: Importance of highway-traffic count, National Highway System status, emergency vehicle route, proximity to other high level highways for detours. Costs of building higher road grades and longer bridges. Costs of repairing damaged roadways and bridges. Roadway damage is generally from over-topping. Bridge damage results from several problems: Channel meandering, high velocities causing scour of berm erosion, very high road grade which eliminates "relief valve" for extreme flooding, bridge too small even for a "typical" flood such as Q50, bridge backwater. Impacts to raising road grades, especially in urban areas. Safety to traveling public. In lowa, FEMA/NFIP and lowa Department of Natural Resources (IDNR) already have regulations/criteria that adequately cover many of our bridges. The lowa Department of Transportation is opposed to any additional regulations or restrictions on hydraulic design criteria. Since each location has unique problems and polential solutions we prefer to continue our practice of analyzing and hydraulic design criteria.

project was formulated to minimize impacts to unprotected areas and designed not to exceed the one foot standard. Consequently, there are no provisions for the Corps of Engineers nor the city of Des Moines to provide mitigation or payment of damages as a feature of this project. You may wish to contact the city of Des Moines to determine if they might be able to assist you in reducing the risk to your computer center. If you have any questions concerning	the flood protection project, please contact the project manager, Mr. Mark Schroeder, at (309) 794-5297. Sincerely, Doyle W. McCully, P.E., Deputy District Engineer for Project Management. IMT insurance Company. ATTN: Ms. Linda Slycord. STORM WATER CONSULTATION. On January 26, 1994, field surveys were conducted at the IMT insurance Company to verify what impact, if any, the increased flood elevations from the proposed flood	control levee would have on potential flooding of your eite. Elevations at key locations were taken and referenced to the City bench mark located on the southeast Bridge Abutment Rail of the Grand Avenue Bridge over Walnut Creek. Our findings are set forth in the following paragraphs. The location where flood waters would first begin to enter your building at 6000 Grand is at the loading dock paragraphs.	your bolloting at cook or and its at the loading dock ramp at the southwest corner of the building. When flooding waters would reach elevation 818.15, the water will begin to flow from the parking ket down the ramp into the loading dock platform is at elevation 818.31. The lowest level floor elevation 818.29 and will receive water entering the huilding at the loading dock that the huilding at the loading dock.	level at the southwest corner of the building during a 100 year flood is 817.6 according to the lows Department of Natural Resources. The projected water level for existing conditions is therefore 8.5 inches lower than the elevation at which water would have building the building of the building to the building the building to the building t	provided by the lowa Department of Natural Resources, the IMT building which is presently protected from flooding at the 100 year flood level, will be adversely impacted by the flood control levee. The second location where the	building is vulnerable from Wainut Creek flooding is in the south patic area of the building. The parking lot top of curb south of the patic area is between elevation 818.4 and 818.5. Once floodwater over tops the parking lot curb, it	has direct access to the old cafeteria patio area and window wall. The impact of the flood control levee project is the loss of the previous .8 foot margin of safety between projected peak flood levels and the top of curb elevation along the patio area. Upon completion of the flood leves the projected neak flood level will be 818.4 which is activated and	the top of curb elevation. The third location where the building is vuinerable from Wainut Creek foodings is east of the south patio area at the windows to the computer room. Atthough the windows are bricked up, the sill area is not	designed to be watertight against flood water. The projected future peak flood elevation of 818.4 is only 8 inches below the window sill elevation of 819.06. In our opinion, the IMT building will be adversely impacted by the	Construction of the variety Creek revee. The 100 year design flood will inundate the building with the levee in place. In comparison, the same magnitude of flood under present conditions would not flood the building. The levee freeboard area flevee height shows the projected 100 was flood in intended to account to the following the projected to be intended to be i	insolution are a recent above an projected for year mostly is intended to provide a raction of safety due to the infability to precisely project flood levels. The level top will therefore be 3 to 4 feet above the projected 100 year flood levels. In the event a flood exceede the 100 year flood levels. In the event a flood exceede the 100 year.	side of the levee would act as a "relief valve." With the flood levee in place, floods in a excess of the 100 year flood will have a relatively higher face in the water level on the list.	Des Moines to act as a "relief valve." Our recommendation is to increase the level of flood protection to the IMT	building to 1 toot above the level of flood protection to the West Des Moines side of the flood control levee. The recommended 1 foot higher protection level is based on the extensive property damage which would occur if the IMT	lower building level would flood. Such protection could be provided by the construction of a 4 to 5 foot high flood wall along the perimeter of the south side of the building, with removable planks at the loading dock and rear	sidewalk entrance to the building. Because a direct adverse impact can be shown for the 100 year design flood from the Corps of Engineers levee project. IMT should request the City of Des Moines and the Corps of Engineers	mitigate the damage as a part of the overall levee project. IMT should include the damage potential from flooding in the lower building level with a requirelland of a region, but the former of the lower building level with a requirelland of a region, but the form of the lower building level with a requirelland of a region but the form of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with a requirelland of the lower building level with the lowe	Mikely Ripidis 19 Internance Comments regarding this matter, please contact us at 225-8000. In our opinion, the potential exists

COMMENT OR QUESTION	level at IMT of approximately 8 to 10 inches above the level which would be experienced during a 100 year	recurrence interval flood without the flood control levee. Flood levels referenced to USGS datum at three locations	along the lint property are shown in the following table: 1. 63rd St., Existing Condition -, With flood levee and full	incur plann encloachment 821.9. 2. Downstream side of Grand Avenue, Existing Condition 819.1, With flood levee	and full mood plain encroachment 819.9. 3. 120 feet downstream of Grand Avenue, Existing Condition 818.5, With	mood revea and full flood plain encroachment 819.2. 4. 620 feet downstream of Grand Avenue, Existing Condition	817.5, Writh flood levee and full flood plain encroachment 818.4. Note: 1986 Flood of Record, measured at 63rd St.:	819.36. The flood levels shown for the flood levee and full flood plain encroachment assume that fill material could	be placed in the flood way fringe area along the east side of Wainut Creek as well as construction of the levee on the	west side of Wainut Creek. Flood way fringe is the technical term for the area of a flood plain which can be	recovered for development purposes without increasing the 100 year flood elevation by more than 1 foot. For	example, the IMI claims building is built in the flood way fringe area and causes limited obstruction to the flow of	water in availud Creek. When the flood levee is built on the west side of Wainut Creek, the constriction of the creek	Detween the mood levee and the IMT claims building should cause water levels to approach the levels in the table	A 100 year flood may requit when approximately 8.7 harbor of a 100 year flood also needs to be discussed.	hour time period. If the rain occurs when the architect a state occurs over the visuality Creek Basin during a 24	than if the rain occurs after a prolonged dry spell. The 100 year flood profection level is used as a common lovel of	protection for normal buildings. It should be noted that large dams are designed for what is referred to se the	probable maximum precipitation level, which is 26 inches of rain in a 6 hour time period, if the level of protection	used by IMT is the 100 year flood level, the question for IMT will not be if the buildings will flood, but when will the	buildings flood. It is not uncommon to hear of rainfall amounts over localized areas in lowa which produce 12 to 15	inches of rainfail. The Corps of Engineers flood levee will extend 4 feet higher than the elevations shown in the table.	From a practical standpoint, floods on Walnut Creek at Grand Avenue can be anywhere from elevation 819.9 to	823.9 without flooding the protected side of the levee. Floods will have to exceed elevation 823.9 before the levee	would over rop and provide relief to the unprotected side of the levee (IMT buildings). CLAIMS OFFICE	BUILDING FLOODING POTENTIAL: The lows Department of Natural Resources is utilizing the recent flood	modeling provided by the Corps of Engineers for determining maximum flood elevations along Walnut Creek. The	Approximate model is more conservative than previous flood modeling which was used to establish building	erevations along waithur Creek. Previous flood modeling established a 100 year flood elevation at the claims office	unuing of 100.5. Oxox datum. The Corps of Engineers model has established a 100 year flood elevation at the same	nocation of 91.4, of almost 3 feet higher. When the claims office was constructed, the minimum protection level	bard of the calms building was solving the Tou year mode devailed per the original flood model. The office	year flood level used by the Corps of Engineers. The Corps of Engineers made to bear the formal of the current 100	feet per second (cfs) in Walnut Creek. The previous flood of record occurred on May 17, 1958, and use selected to the condition of the conditions and use selected occurred on the conditions and use selected to the conditions are selected to the conditions and the conditions are selected to the conditions are	have a peak flow rate of 12,500 cfs. The Corps of Engineers flow projections for a 100 year flood is therefore 36%	higher than the flood of record. In addition to the peak flow rates used in the flood modeling, the condition of the	flood way vegetative growth also impacts flood levels. Flood ways with substantial willow trees and brush will cause	much nigher flooding than identical flood ways without vegetative growth. Caution should be used in flood protection	presenting for continued lines which are not accounted for in flood models including obstructions of channels by sand	most current flood model 100 year flood level in our carindon the claims building office is 5 inches higher than the	damaging flooding. As a minimum, important documents should not be showd in the house.	file drawers. MAIN OFFICE COMPLEX: The main office complex has a ground floor along ton of 944.97	first floor elevation of 827.34 according to 1958 plans of the building. The ground floor is vulnerable to flooring	entering through the south wall of the building where the former cafeteria was located. The slevation in the matic	area was shown as 814.4 on a flood certificate signed by Bishop Engineering. An apparent discrepancy exists in the	data used by the Corps of Engineers which shows the "First Floor Main Building lower level (rear)" elevation for the	im to mice as \$15.05. They have apparently missed the significance of the ground flood level of IMT in evaluating	the control of the co	contoing as elevation 817.8 (city datum 44.0). The Corps flood model shows an "Existing Condition" flood elevation	Andrew CON Land January 1 4 A 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

			Dy a flood warning of severe weather warning issued by the National Weather Service. (Map included in papers.) To: Dean Honnold From: Linda Siycord RE: Meeting today at 11:00 a.m. Today's meeting will be with Mayor Pat Dorrian, Assistant City Manager John Bryan, George Nagla, you and I. We will review the reports from Veenstra Kimm Engineering and the levee map. George Nagla will bring you photo copies of all materials prior to the meeting. We have currently spent approximately \$2,500 on engineering services and contracted with crose-Gradner Associates, Landscape Architects for the wall and design for approximately \$2,500. We have not yet received bids for the sewer by-pass work. At the direction of the board, we are updating the estimate to move would flood, we have potential foes of \$3,000,000. These estimates were furnished to the Army Corps of Engineers
	Missouri	je o	The time for taxpayer subeldization of flood plain development to be halted is now. Federal dollars spent in the past for levee constituction have encouraged development of high risk areas. Following the 1993 flood those who benefitled the most from federal assistance to levee districts are urging us, the taxpayers, to get them up and operating again. Fit he most from federal assistance to levee districts are urging us, the taxpayers, to get them up and operating again. Portions, of upland farms to reduce or stop production? The bottom line is: we do not really need the flood plain production and pay to keep flood plain from the levees, the farmens. I think that if they want to production and pay to keep flood plain from the levees, the farmens. I think that if they want to be in production are those who are getting the most benefits from the levees, the farmens. I think that if they want to be in production are those who are getting the most benefits from the levees, the farmens. I think that if they want to be in production are those who are getting the most benefits from the levees, the farmens. I think that if they want to proportion of our wetlands in this country to agriculture that some species that need that habitat type are in danger species diversity, we bose our quality of life. Flood plains contribute to the nutrient flow in the aquatic environment. As the amount of nutrients available to the river ecosystem is restricted by levee construction, the standing crop of fields last summer and fall are proof of what could occur every year if adequate flood plain is pace were available. Where have all the big fils gone? Maybe they can no longer sizes in the abundance of years past, suggest a compromilee with agriculture. Discontinue flood protection assistance and see how many are willing to take plain has to do it on their own. There are more comments I could make, but this has been enough. Thanks for
ę <u>o</u>	E. Peorta, Illinois Savanna, Illinois	Other Industry, Self Self, Farmer	I have always thought that management of the river systems should be along natural, ecological ways of thought. The mess we experience is attributed to human intervention without acknowledgment of the natural systems involved. If more natural scientists are used instead of engineers the systems would work more harmonlously with less expense to the taxpayer and the environment. I thank you for letting me air my viewpoint. I got a farm on Plum River about 6 miles from the Mississippi River near Savanna, III. We get some severe flooding on this river. In 1993, water covered my land for 45 day during the simple.
			down. On average about every 3rd year it floods and they were talking about buying easement so they could go back to trees and grass. I think that might be a good idea. But when they do this they should take all farm ground on the
	Cakville, Iowa	Crity Gov*t	I thank you for the opportunity to visit with the representatives of the Corps at the informational meeting in Burlington. Being on a tight schedule at that time I chose to make my comments on the attached paper. I appreciated the working relationship that the city of Oakville had with the Corps during the flood. I found the personnel to be very knowledgeable and responsive to the difficult situations that we faced during that time. ATTN: COE. At the informational meeting held in Burlington, lowa, I voiced my concerns on several issues facing the city of Oakville, all of which could have a devastating impact on our livelihood and safety. The lowa River, over a period narrowed and become shallow resulting in the ice freezing to the bottom in the winter and literally sitting on the sandbars that make up the majority of the river bed. A significant flow of water coming from upstream causes the integrity of the structure. In most instances, the displacement of water that would and should flow in the confine of the resulting in the confine.

2	CITY, STATE	INTEREST	CODE COMMENT OR QUESTION
ก	Mahomet, Illinois	University	I am interested in a thorough study of the flood of 1993. I am preparing a book on the impacts and responses made to the flood.
25	lowa City, Iowa	Seif	1. Equipment should be installed to allow all dams managed by Rock Island to be controlled remotety, with appropriate safeguards. This would be an inexpensive, but invaluable backup system in the event that an engineer is unable to get to the dam during a crisis. It would complement the existing measures to automate notification of Rock Island officials of high water conditions. 2. Past COE reports are marked by a lack of interaction between the working groups (economic, hydraulic, environmental, etc.) during the study process. A good example of this is the 1991 study of the Corawille reservoir management plan in which each group seems to have written their section nearly independently of the others. Strong coordination between the groups at every step should be considered an explicit part of the study process, so that the final conclusions accurately reflect the strong interactions found in the system being studied.
23	E. Peoria, Illinois	Self	The river flood plains should be used for the river-let it flood when it wants to. Man has always tried to down rate
¥	Lockport, Illinois	Agriculture, Self	The US Army Corps of Engineers should restrict it wonerations to major navinable them.
SS	Manhattan, Kansas	Self	Delieve that flood control should take precedence over recreation. The language metals and around Manhattan could have been avoided with better management early on. Many people were hereaved by an arroward four
8	Manhattan, Kansas	Agriculture, Private Int. Group	We own property in the flood area. But we had no water in '93 flood. We are in the process of selling our property, so we do not live there now. We do feel the flow from Little Creek Lake could have been handled different and taken care of by our local area better.
75	Atchieon, Kansas		lam definitely not incaration botton. I am definitely not incaration botton. I am definitely not in favor of making the Sugar Lake area into Wetlande. For many different reasons, not the least of which is the fact it has been my home for over 30 years, and my family for over 60. For economic reasons: If the area was converted to wetlands, then 59 Hwy. would be in jeopardy, and the towns of Atchieon, KS, and St. Joseph would suffer. These two towns are sleeper communities to Kansas City, MO, and without 59 Hwy. there would be no convening the time. The fields are productive for the farmers, and convening the area vital farm grounds located in this area, and even though the farmers, and produce food. As far as the environmental aspect, I am not in favor of mandatory displacement of people, and in this case a whole community to protect a particular species of fish or fowl. Making this area a wetland is not letting nature take its course, 90% of the time, this area is as dry as any other. In my opinion the government could take other proactive measures. For example if you live in a flood plain, and choose not to carry flood insurance, there would not be FEMA grants, which I am told went up to 11,000 per family in my area. I know of at least two homeowners who were left with nothing, when FEMA awarded grant money to tenants who were buying on contract, who of course took the money and ran. The federal government at times is almost too nice to people in terms of handouts, in my opinion if you choose to live in a flood zone, you better be able to afford flood insurance. But don't make everyone suffer because of government policy of handout and then trying to dictate where people can and

		VOIT sand working the
58 Kanese City, Missouri	Acriculture	cannot live. As if people were not smart enough to make their own decision. The federal government needs to do a better job of educating people in regard to flood insurance, and make communities enforce the rules when it comes to rebuildings. I carried flood insurance, but did not know I could have taken our more coverage, or that out buildings are covered at a percentage of the amount carried on the residential structure. I am sure that the main driving reasons behind this wetland proposal is the money. If has taken a lot of different avenues, but there is no need to protect people from themselves. I think it would be a good idea to let the individual take on the responsibility of deciding whether they want to reside in a flood piain, and the consequences of that decision. I was a flood victim, and while the temporary assistance was greatly appreciated, it was definitely not expected. I feel like the main problem with this type of decision, is it will be made by people who live out of state and have no idea of the consequences. Broad control yes maybe, but government mandates—NO. Our government continually formulates government policy based on special inferest groups, and people that do not want to be held accountable for their decisions or actions. I read the Flood of 1993 in the Midwest cost 16 billion dollars, in comparison to 29 billion for the L.A. earthquake. The midwest flood covered six states, the earthquake, one major town. If policy were to be changed strictly for economic reasons, where would you start? Because California has more representatives in Congress, and strictly for economic reasons, where would you start? Because California has more tax paying citizens than any midwest state, will continue to occur, well it doesn't take a rocket scientist to figure out L.A. will have another earthquake. I must apologize for the sarcasm, but I can tell you the flood i went through wasn't nearly as stressful as the aftermath of wondering if our local level free to contact me I would be nown in we can plan
	Agriculture, Env. Interests, Self, Hunting	Please let us know the status of the wetlands and ox bow land purchase by the government. Can a property owner hunt on his ground next to a wildlife area? Can a property owner lease ground to farm or hunt next to a wildlife area? Will you still want the Fahrmeier tract partly or entirely in the Berger, MO bottoms? Please send these
	Agriculture, Other Industry, Excavating	We are definitely against the proposed wetlands. This ground is our livelihood, we need this ground for crops so we can stay along the may be some ground not as productive as this and I feel strongly that it would be unfair to
60 Washington, Missouri		This is very good farmland by the MO river here in Wash., MO. We do not need it turned into wetlands. Our roads go through there also.
	State Gov't	1. Eliminate Crop leased land properties. Enforce lease restriction of no federal assistance. 2. Procure digital elevation for the entire state of lowa. This could benefit the states' G.I.S. system. 3. Update Corps dam operation plans to address quicker releases, lower pre-flood pools; more accurate modeling of in/out flows. 4. Update Dam Safety Plans-Specifically accurate inimidation bases.
62 Hull, Illinois	Agriculture	Need some becold to answer rulestions and make assessment the company of the comp
	City Gov1	Industrial needs for large quantities of water from Ziluvial Valley must continue to increase. Employment provided dedes not mean residential evelopment must follow in the valley but can be on high ground. Air, land, rail, water transport must be interinked, obviously in the valley. Protection of water/waste water treatment requires very high (improved) level of protection. I.E. Freeze residential use of flood plains and areas protected by industrial levees. Accommodate industrial and transportation features, permit recreational and agricultural use. Accept beginning and those on farm resident operators. Power plants protected to industrial levels by site when not inside equal level of protection.
	County Gov't, City Gov't, Planning	The system of incentives and sanctions in the NFPI program should be completely overhauled. Local jurisdictions are not held accountable for continuing development in the flood plain. The river Commerce should be brought closer to actual costs of operation with less subside subside to more risk should be assigned to individual homeowner, farmer, business, industry and lose to the taxonics.
	Ag., O. Ind., Self	
	County Gov't	You need to do a much better job of contacting interested individuals with a timely notice. Otherwise you have no credibility.
	Self	Import of the Nutwood levee, and the effects of levees above and below Grafton, on the water level, during flood at Grafton, Hardin, Ebsah, Also need convict Gallager Board
68 River Falls, Wisconsin	Env. Interests	1. I favor a federally funded program to buy back all agricultural land which was reclaimed wetland originally. 2. Let's not repair levees and dams for reservoirs unless they are critical such as for toxic chemical facilities, water treatment blants and water nutrification facilities.

We can't possibly to the work of the way in straining the work of the way in straining the way in a state of the way the work of the way in the work of the work

n Dam areas.

			Afficial maintain and the second seco
			enricient and teast polluting of present types. Also the flood plain should continue to be allowed to be used for agriculture. This bottom land is very productive, therefore not as much erodable land needs to be cultivated. As far as leveres causing floods, if this were the case no floods would have occurred before European immigrants arrived on this
82	New Haven, MO	Agriculture	There is a much land in Wetland already. And for the dam's they should be used for what they were built
83	Washington, MO	Agriculture	Tarm not sure I favor the height of levees that are used today. I do however favor levees that control the normal annual spring rains and snow thaw water so that agriculture can plan and do spring planting. I feel lower levees would do that but in case of unusual amount of rainfall the river could spread out sooner
84	Washington, MO	Agriculture	and handle the amount of water with less damages as was witnessed this past 1993 flood.
ജ	Marthasuille, MO	Agriculture, Missouri Valley Levee District President	I am writing in regard to the Corps' idea of raising that stage of the Missouri river in the early spring because the spring always brings a high stage and will only add to the flooding of bottom land that is not protected by levees and also will add to the seep water on lands that are protected by levees also. And are the fish really on the endangered species list? Also it is going to add to the problem of more and bigger trucks on our highways to add to the problems of more serious accidents and our Federal and state roads being damaged by these trucks. Also who will compensate agriculture for these losses they
98	New Haven, MO	Agriculture	Very concerned about the flood management plan and the effect it will have on the farmers and all
87	Washington, MO	Agriculture	I feel that the levees should be built up if the rivers will be used for boats. The water level will be higher and in spring we get rain and in 1929 the June rise claimed a lot of corps that was before the river was leveld. Wet land does not cause flood. A sure sign of a flood is two full moons in one month. I kept a record of this the more the higher the water level if it rains. I feel the Missouri River should be leveld higher to maintain a higher water level for boats. It is an asset to towns like Washington, New Haven, and Hermann and other email founce.
88	Marthasville, MO	Agriculture	I am farming on one of the tributaries of the Missouri River. I lost most of my 93 crops. The changing Missouri River by the Corps of Engineers will be pushing the backwater up on my Spring when I am planting a crop. We don't need any most making.
88	New Haven, MO	Agriculture	[fee wellands are not needed.
8	Washington, MO	Agriculture	To the best of interest of our farmers, I feel it should be a shame to put this good farm land into wet land. For we need these crops in our acres.
-6	New Haven, MO	Agriculture	My primary concern is that the waterways be maintained for maximum use. As a most efficient and timely means for moving commodities via barge transportation. I am sure you have been advised statistically of the advantages of this transportation.—Please give you most serious constitutional densities.
85	Valmeyer, IL	Self	Flood plain management of the upper Mississippi and lower Missouri River must concentrate on protecting prime farmland which is vital to the survival of the Midwest farmer. The only feasible way to do this is to maintain and improve the property of the Midwest farmer.

April District Summaries and Statistical Data

St. Paul District April Meetings Summary and Statistics

APRIL PUBLIC MEETING PRESENTATION - 1995

Hand outs on table near door: Executive Summary, Findings, Conclusions, and Hydraulic Tables. GIVE PEOPLE A COMMENT SHEET AS THEY ENTER THE ROOM.

PRESENTATION:

SLIDES	

NARRATIVE

10 to 15 minutes - Brief intro to Study and Systemic look at Mississippi & Missouri Rivers

BLANK SLIDE

3)Brainstorming

1,2) Present FPMA STUDY - Floodplain Management Assessment (need slide to keep organized - highlight & show again, as move through presentation) The study was directed by Congress/ authorized in November 1993; started in January, 1994 and is to be completed in June.

This assessment compared the impacts of the 1993 flood within floodplain management philosophies, flood control measures, and

selected river reaches.

4) Regional location

The work was accomplished by five districts located in the midwest: St. Paul, Rock Island, St. Louis, Kansas City, and Omaha. The study area covers 3,500 miles of the Mississippi and Missouri rivers, as shown.

5) Word slide 6.7) 2 products

Products from the Study: development of UNET hydraulic model to show system-wide effects; GIS mapping of land use, environmental resources, critical facilities, and watersheds; historical overview of floodplain use; and a data collection from economics, environmental, hydrology/hydraulics and the institutional players involved in floodplain management. Slide 6 shows saturated soils in the watersheds of Missouri and Mississippi Rivers. Slide 7 shows Counties receiving disaster aid (includes counties not in floodplain).

Do not mention unless questioned (Scheduling for this report did not allow time for completion of all mapping products; evaluation of all river reaches subjected to flooding in 1993, or coordination and evaluation of all data complied.)

8) Landsat image

Flood description: The 1993 flood was the greatest flood ever witnessed in some locations. Landsat image shows St. Louis Flood area: difference from July, 1988 (on left) to July, 1993, after flooding (on right). Persistent rainfall and flooding was unprecedented. 80% of damages were not related to overbank

flooding and damages, in general were much lower because of the existing system of Federal levees and reservoirs. This extreme flood inundated a large percentage of the floodplain and demonstrated how plants and animals, adapted to a flood-pulse (especially fish), can positively respond to a flood. Impacts of the flood on the floodplain forest will generate long-term changes in forest community structure. The stage reduction of the 1993 flood does not automatically equate to reduced flood damages.

EXISTING RESOURCES/ BASE CONDITIONS

Very different land uses occur on the floodplains of the Mississippi and Missouri river systems and between upper and lower reaches of these rivers. Slide 11 shows land use of both rivers combined and Slide 12 shows the rivers separated. Agricultural use accounts for over 75% of the Missouri River floodplain while the Mississippi river has between 31% to 64%, depending on the river reach. Wetlands and forests account for a higher percentage (15% to 25%) on the Mississippi than on the Missouri river (10%). Role of wetlands in flooding - A wetlands ability to absorb flood waters and possibly reduce flood damages varies by the 1) type of wetland, 2) location of the wetland within the watershed, and 3) wetlands hydrologic "condition" at the time of the flood. The "condition" can either increase or decrease flooding. Slide 12 shows the difference between a "dry base condition" and a "wet base condition," as what happened during the 1993 flood event, when existing wetlands were filled early. The sponge analogy is appropriate to some wetlands during some periods of the hydrology cycle: sometimes the sponge is dry, sometimes it is damp, and sometimes it drips all over the floor! Wetlands are an important part of upland runoff reduction and floodplain storage and conveyance. Floodplains provide opportunities for a wide range of diversity that includes both private individual and societal benefits: improves water quality, wildlife/fish habitat and gives people a place to recreate or rejuvenate in a natural environment.

15) Word slide

NATIONAL FLOOD INSURANCE PROGRAM: A number of reforms are included in Title V of PL 103-325 in 1994 that

strengthened compliance with the insurance requirement and expanded flood hazard mitigation planning opportunities. An expanded definition of flood risk beyond the current 100 year floodplain standard may be needed to achieve an improved understanding and appreciation of the potential for extraordinary flood losses in highly developed areas. Community Rating System has the potential to improve floodplain management and avoid flood damages.

16) Word slide

STATE AND LOCAL FLOODPLAIN MANAGEMENT/ZONING **REGULATIONS:** Need for more effective local land use planning and zoning requirements, strict requirements for siting critical facilities, and an increase in the number of individuals and businesses that carry insurance - in order to meet responsibilities for flood risk.

17) Word slide

RELOCATION, MITIGATION, AND DISASTER RELIEF: Flood hazard mitigation options, particularly acquisitions (buyouts) of substantially damaged structures, have been a more prominent part of the Federal response in recovering from the 1993 flood. Close to \$200 million have been budgeted for future mitigation. Future disaster assistance and insurance needs could be significantly reduced if the problem of repetitively damaged structures is firmly addressed. Actuarially sound flood insurance coverage would help assure that those who invest and live in the floodplain accept appropriate responsibility for the damages that result from floods, especially new development.

18) Word slide

FLOODPLAIN RESTORATION: Floodplain restoration, as 19) Profile of floodpl. opposed to wetland restoration, requires changes in the levee system to restore natural hydrologic functions and create the linkage back to main channel areas. Floodplain Management is not simply "Flood Control." Conversion or restoration of a small percentage of agricultural land use to wetland or other natural conditions can significantly increase the existing percentage of natural floodplain acreage. Such land conversion in the floodplain would not reduce flood peaks, assuming the same floodway width, but would have reduced payments for agricultural damages and provide many benefits beyond simply flood control. Current theories on floodplain function predict that the area needed for an improvement to the natural biota is probably fairly small and that restoration of a series of natural floodplain patches (a string of beads) connected by more restricted river corridors would be

20) Word slide

AGRICULTURAL SUPPORT POLICIES AND CROP INSURANCE: The extent of floodplain acreage suitable for

practical and beneficial.

conversion or restoration is small in compariason to the floodplain acreage that would continue to be farmed. Levee repair criteria are not sufficiently based on repetitive break or maintenance history; environmental considerations; hydrologic analysis; economic analysis; or system-wide effect.

DRAFT

ALTERNATIVE ACTIONS AFFECTING HYDRAULIC CONDITIONS IN THE FLOODPLAIN

METHOD OF ANALYSIS

The mathematical computer model program UNET, developed and programmed by Dr. Robert Barkau, was chosen to simulate the river system as the hydraulic basis of this study. UNET is a one-dimensional, unsteady flow program which simulates unsteady flow through a full network of open channels and reservoirs. A UNET unsteady flow model was constructed of the Mississippi, Missouri, and significant tributary rivers. Corps District offices along the Mississippi River include St. Paul, Rock Island, and St. Louis. Corps District offices along the Missouri River include Omaha and Kansas City. While coordinating with all involved Corps Districts, each unsteady flow model was developed independently. Assimilation of model results and system wide routing was then performed for all conditions examined between adjacent Districts.

During the 1993 flood, the Missouri River experienced three flood crests. Many of the agricultural levees within the Kansas City District failed as flood stages exceeded the design height of the levees by several feet. On the third and highest crest, virtually all agricultural levees were overtopped and there was significant overbank flow. A unique levee algorithm was programmed to represent the Missouri River levees and simulate their singular mode of failure that was manifested during the 1993 flood event. The Missouri River levees failed early in the 1993 flood event, and subsequently the protected area behind the levees filled with water from the river. During the final third crest, the levees degraded and the floodplain behind the levees actively conveyed flow. The Missouri River functioned under two geometric conditions: one in which levees constrained the flow to the channel, but provided storage behind the levees; and the second in which the levees no longer constrained the flow, and the overbank actively conveyed water as if the levees did not exist.

With the new levee algorithm, UNET models levees in the manner described in the following two paragraphs: When a levee fails at a breach and the area behind the levee subsequently fills, the flow through the breach section depends on the elevation of the river and the elevation of the water in storage behind the levee. The water surface inside the levee interior is assumed to be horizontal. When the river elevation exceeds a specified elevation, or when the river discharge exceeds a specified flow, then the levee storage cross-sectional area and conveyance is added to the river cross-sections and the program routes flow through the channel and the entire width of the floodplain. When the river falls below a specified elevation or the flow falls below a specified discharge, the levee storage cross-sectional area and conveyance is subtracted from the cross-sections and the river once again interacts with the levee through the breach.

ACTIONS EVALUATED

Alternatives. Several alternatives were analyzed to address flood plain conditions and study objectives as outlined in the correspondence authorizing the study. Many questions have been raised following the 1993 flood concerning the impact levees have on flood heights. This included various alternatives involving the existing agricultural levees and several upland retention/watershed measures both structural and nonstructural. Evaluation of levee action alternatives focuses on agricultural levees because the vast amount of land protected by these levees offers the potential for storage of flood waters. In most cases, limited opportunity for storage or conveyance of flood water exists behind urban levees because of the relative size of the protected area. Agricultural levee alternatives include levee removal, levee confinement to contain the 1993 event and altering levees to provide only a 25-year level of protection. Upland retention/watershed measures include no main stem

reservoirs, runoff reductions of 5% and 10%, and revised operation of main stem Missouri River reservoirs. All the above alternatives were system wide and included passing flow and stage information from upstream districts to downstream districts. Impact study reach evaluations were also completed for several reaches within the assessment area.

Base Condition. Levees in the base condition model include freeboard added to the levee crown during flood fight operations. Although the additional freeboard in most cases did not prevent levee failures during the 1993 flood, it did affect the timing of the failures. Had additional height not been added to the levees, failures would have occurred much earlier in the event. Levee failures in the base condition model were reproduced on the dates and times they actually occurred. In all other alternatives modeled, levee overtopping was dependent on the relationship between the levee crown elevation and the water surface elevation of the river. Timing of levee failures plays an important role in determining the effects levees have on flood stages. Levees which fail close to the peak of the event, may have a substantial impact on flood stages. Results of the base condition analysis closely matched the 1993 flood event.

Agricultural Levee Alternatives. The effects of several alternative agricultural levee heights and locations were analyzed employing calibrated UNET models developed for the base condition. For each alternative, the base condition UNET model was modified to reflect geometry changes required to simulate the effect on conveyance within the model. Calibration parameters determined in the base condition were not altered for any of the alternatives. Since no federal agricultural levees exist either upstream of Omaha, Ne, on the Missouri River or upstream of Lock and Dam 10 on the Mississippi River, only the UNET models downstream of these locations were used to assess the systemic alternatives.

Levee Removal. For this alternative, all agricultural levees were removed. Simulations were performed with both a minimum and maximum roughness level within the overbank area. Roughness values were selected to provide a reasonable lower and upper bound for computed results. Factors affecting conveyance were not evaluated in detail. For example, removal of the levee would not result in an effective flow width equal to the entire valley width. Physical factors such as channel meandering, vegetation, topography, structures such as roads and railroads, and other components will restrict effective flow width to a value much less than the cross section width. Various forms of land use within the overbank such as farming and natural habitat will have considerably different roughness values. Levee removal will remove channel constraints such that channel meandering and overbank sediment deposition may actually reduce conveyance. The roughness values chosen for the area between the existing agricultural levees and the bluff represent both Manning's "N" and non-effective flow areas. Land use between the river and the levee was assumed to remain the same as it is now.

1993 Flood contained within Agricultural levees. For this alternative, all agricultural levees were raised infinitely high such that the 1993 flood event was confined to the existing area between the levees. Levee locations or roughness values were not altered for this alternative.

Levee Height at 25 Year Level. For this alternative, the height of all agricultural levees were set to correspond with an estimated 25 year profile based on previous hydrology. Federal levees, which are currently higher than the 25 year elevation, were notched to an elevation equal to the 25 year elevation. When flood levels exceed the 25 year level, the levee cells fill with water. In this manner, the levee cells along the channel act as detention basins to store water when river elevations exceed the 25 year elevation.

Upland Retention/Watershed Measures. Various upland flood retention / reduction measures exist which may affect inflow rates to the river system. For the evaluation of these measures, no modifications to UNET model geometry were performed. Assessment was performed by adjusting inflow hydrographs to the UNET model for each scenario examined.

Without Federal Reservoirs. The analysis of the 1993 flood event without the federal reservoirs storage was accomplished by determining the discharge hydrograph at each site without the storage effects of the reservoir. These unregulated hydrographs were then routed downstream to determine the effects on peak discharges and stages at critical locations. The hydrographs were routed to the Missouri and Mississippi mainstems from the upstream tributaries using hydrologic routing and the UNET model was used to route the hydrographs through the floodplains to determine resultant water surface profiles. The flood storage in federal reservoirs had significant impacts on flood stages during the 1993 flood on the Mississippi River from Grafton to Cape Girardeau and on the Missouri River from Gavins Point Dam to the mouth at St. Louis. Flood stages in these reaches would have been several feet higher if the federal reservoir system had not existed.

Runoff Reduction. For this alternative, measures which would reduce the total runoff volume during the 1993 flood were evaluated by reducing mainstem and tributary inflow hydrographs to the model by both 5 and 10 percent. Based on the St. Paul District's preliminary studies of wetland storage and other upland retention methods, it was determined that the maximum reasonable amount of available storage would reduce the total runoff volume into the Mississippi and Missouri Rivers of between 5 and 10 percent. Depending on individual drainage basin characteristics, some tributary basins could store more than 10 percent of the basin runoff volume and some tributary basins have little or no upland retention storage available. To simplify the UNET modeling, all the inflow hydrographs were reduced by an equal amount. In reality, runoff reduction would not be distributed equally over the total inflow hydrograph but instead would have a major impact on the shape of the inflow hydrograph at the beginning of the 1993 event and would have little or no impact on the peak discharges and stages on the river.

Missouri River Hydraulic Impact Alternatives Change in Stage from 1993 Flood

Roughness values for the floodplain were selected to represent variations in land use and provide an upper and lower bound for overbank conveyance. Data on bridges, roads, railroad embankments, and existing vegetation were unavailable for the model. As a result, effective overbank flow area is overstated at some locations. Although further analysis may result in different stages for the without levee conditions, the general trends should remain the same, Note: Values in this table are approximate and appropriate only for this assessment. A more detailed model is required to accurately estimate the flow capacity of the floodplain.

REMOVED - MISSISSIPPI RIVER AGRICULTURAL LEVEES

- MISSOURI RIVER AGRICULTURAL LEVEES REMOVED

20 April 1995 FN: fpmamtgs

QUESTIONS ASKED AT FINAL TWO FPMA PUBLIC MEETINGS IN ST. PAUL DISTRICT

- 18 April 1995, South St. Paul, 7:00 8:30 p.m. (10 attendees)
- 19 April 1995, La Crosse, WI, 7:00 8:45 p.m. (18 attendees)

South St. Paul Meeting, 18 April 1995

QUESTIONS & RESPONSES

1. In the slide presentation, why is there a major difference in stage reduction with the ag levee removal alternative in comparing the "continued agriculture low roughness" condition and the "natural high roughness" condition?? At Nebraska City, the low roughness condition resulted in a much larger stage reduction than the high roughness condition, as expected (-4.7 ft. and -2.3 ft.), but at Kansas City the opposite pattern is shown in the bar chart (only -1.2 ft. with low roughness but -2.9 ft. with high roughness). Why??

(Scott Jutila provided the response after the meeting, indicating that a much narrower channel width at Kansas City is responsible for the unexpected reversal of the stage reduction pattern in comparing the low roughness versus high roughness stage changes at this location).

2. In the GIS map slide showing critical facilities, does the shaded area represent the 1993 extent of flooding?

(Terry Birkenstock confirmed after the meeting the initial response given to the question when it was asked, that the shaded area in the slide did represent the 1993 flood extent in the reach below the Quad Cities).

3. Is there some value in extending flood insurance requirements to areas protected by levees?

(Curt Meeder responded that it is an interesting concept that was identified in the Galloway report, but that the NFIP reform legislation in 1994 did not include any such provisions).

4. Did we consider different types of flooding, such as that caused by rapid snowmelt, as a part of the Assessment?

(Response was no; focus was on the 1993 event).

5. Is there a "threshold" on the number of ag levees that can be built before you begin to increase downstream river stages dramatically?

(Scott Jutila provided the response, indicating the systemic impacts can now be examined through use of the UNET model. Otherwise, there is not a simple answer for any given reach or for the system as a whole without doing a substantial number of model runs. Ag levees can cause changes in stages upstream and downstream.)

6. Who can best benefit from the information in the report?

(Dave Loss responded that the report will be transmitted back to Congress in response to the study authorization. Findings and conclusions should assist policy makers in considering changes that will improve floodplain management practices).

7. An anecdote was provided from the audience about a government buyout of farmland in Iowa, where the DNR apparently turned around and leased back the land to farmers.

(Dave Loss and NRCS rep responded that such a situation could occur, but that the government liability for disaster assistance would certainly have been removed, meaning that farming on the leased acreage would be entirely at the farmer's risk).

8. What policy changes might happen in the next 5-10 years? The report contains a lot of good ideas, but what is likely to get implemented?

(General discussion ensued with mention being made of the FEMA national review of Natural Hazards Mitigation strategy, with a draft report out and a final report forthcoming, including such concepts as all hazards insurance, etc.).

La Crosse meeting, 19 April 1995

QUESTIONS & RESPONSES

1. What about past Corps actions that have contributed to more flooding, such as wing dam construction with subsequent siltation behind the wind dams? The observer insists that filling in takes place and restricts the flow capacity. It's like putting sand in the bottom of a glass; it takes less water to overflow or "flood" the glass once the sand takes up space at the bottom.

(Response from Scott Jutila and Dave Loss explained that main channel is scoured, providing a larger, deeper main channel cross section for increased flows. Assessment finding on this subject is that Corps structures did not contribute to worse flooding on the Upper Mississippi River during the 1993 flood. The Missouri River situation is not able to be answered without more research).

2. Some in the past have suggested that the dam gates should be opened in advance of floods to pass more water down sooner ahead of the arrival of flood waters.

(Response from the audience {Arne Thomsen from La Crosse Project Office} and from Scott and Dave is that there is almost no storage available for flood control purposes on the Upper Miss main stem and that such a strategy would not work for major floods on the river.)

3. Farmlands that were drained seemed to have the most flood problems. Conversion to farmland speed up runoff to the rivers.

(Scott's response basically confirmed the observation, especially in areas shown on the slide with high percentages of hydric soils).

4. City of La Crosse changed the flood gages at time of 1993 flood to a location half a mile farther downstream, with a one foot lowering of the gage readings at the new location in comparion with past readings at old gage site. Residents were caught unaware because they were not informed of this change.

(Arne Thomsen confirmed that a satellite network/gage reading problem led to the change in gage location and that this information and the change in stage readings that resulted were not communicated adequately to local citizens in advance of the flood).

5. Forecasts have been inadequate and untimely at times of flood in this area of the basin. Information has not been made available to the public. Accuracy is only 10 hours in advance of the event or less. The questioner recognizes the challenges and even suggests that they ought to be acknowledged.

(Scott/Dave response was that technological improvements in forecasting and flood modeling are being made; the National Weather Service has lead responsibility).

6. The Corps needs to consider the original river conditions and the subsequent man-made changes to the river as impacting flooding. Bridges also restrict flood flows. New bridge at Prairie du Chien in 1973 backed up local flows by one foot and made the local flooding worse. These types of changes should be communicated to the public. Bridge approaches can also constrict flood flows, not just the bridge piers or abutments.

(Scott's response acknowledges localized effects on flood flows for up to 1/2 mile upstream of the point of constriction, but no systemic impact).

7. As the Corps regulates the pools, can we provide <u>advance</u> notice, not just after-the-fact day old reports in the local newspaper? A mistake happened this past winter, where the pool level was allowed to drop a stage of 4.1 feet and large fish kills occurred locally.

(Arne's response confirmed that gate adjustments are made daily at L&D 8 with the Water Control office in St. Paul issuing the instructions for these daily gate settings. No real way to provide advance notice of what gate adjustments will be.)

8. What are the comparative damages between the flood damages on the Mississippi River and those damages occuring from other disaster around the country and world? Is evacuation of floodplains the only answer? There is a sense of unfair treatment in the Federal response. Private landowners want to be able to develop and provide tourism and recreation opportunities, but FED \$ STATE government restrictions on floodplains, wetlands, maintaining high value

farmlands in urbanizing areas, etc., all restrict private landowner rights.

(Dave's response indicated that the assessment was not recommending any restrictions on private land use rights, but was directed at wise use of floodplain resources).

9. Are we going to analyze more frequent flood events?

(Dave's response was that this work would be useful follow up effort but that it is not a part of the FPMA and not a part of any study authorization at this time).

10. How does this effort differ from the post flood reports recently published?

(Dave's response was that the post flood reports covered the meteorological and hydrologic aspects of the 1993 flood with some limited data on economic damages. The FPMA report is much more detailed with hydaulic modeling outputs, policy/program reviews, much more flood damage and environmental resources data, etc.)

11. Who is going to follow up with any policy changes? What is going to happen to FEMA?

(Dave's response is that the report will be transmitted to Congress. The political process will have to determine what actions will be pursued, but that the results are not intended to be only placed on a bookshelf. A lot of interest continues in this subject and there is momentum for significant changes. Many actions have already taken place with flood insurance reform, etc.)

12. More local press attention is needed in announcing these meetings and in covering this issue.

(Response confirmed that 3 notices had been provided to local media in advance).

Questions/Responses summary prepared by:

The SPSS/PC+ Statistical Package for the IBM PC was utilized in the St. Paul District. The Omaha, Kansas City and St. Louis District's prepared and provided a data file to the St. Paul District to be incorporated into the SPSS/PC+, for the statistical data sheets that follow. Rock Island had their own computor spreadsheet package and provided a summary of their data tabulation, from the comment sheets completed at the Moline, Burlington, and Quincy public meetings, to the St. Paul District.

Rock Island District April Meetings Summary

SUMMARY OF ROCK ISLAND DISTRICT APRIL FPMA MEETINGS

The final round of public meetings for the FPMA were held on April 18th, 19, and 20th in Moline, IL; Burlington, IA; and Quincy, IL. The announcement for the meetings included an executive summary of the major findings and conclusions. It was sent to about 350 people from a mailing compiled at the start of the study and expanded as meetings were held and more people became interested in the study. In addition, copies of pertinent chapters with the findings and conclusions was sent to a list of 50 people who showed a strong interest in the study or who were officials of levee districts or government agencies.

After the presentation, questions were answered and the attendees were asked to complete the pre-formatted comment sheet. this sheet was designed by the Public Involvement Team top solicit a response that could be tabulated to identify the desires and priorities of the people attending the meeting.

The results of the tabulation indicated the following information:

Respo		attendees	% of attendees	% of total attendees
Moline	38.	42	91%	26%
Burlington	48	53	91%	33%
Quincy	59	72	82%	41%
Total	145	167	87%	100%

Primary interest of respondents

Agriculture	61%
Government	10%
Home owner	10%
Environment	6%
Other	13%

Where respondents live

Protected agricultural flood plain	47%
Outside of flood plain	37%
Unprotected urban flood plain	8%
Other	8%

The attendees were asked to consider that the goal of flood plain management is to minimize the vulnerability of people to floods, reduce flood damage and costs, and improve sustainability of the flood plain environment. Given those goals, they were asked to indicate the priority they would give to the following policies and alternatives.

Priority given to policy issues	Low	Neutral	High
---------------------------------	-----	---------	------

National flood insurance	23%	9%	25%	19%	19%
State flood plain management	25	6	19	30	19
Local flood plain management	18	9	16	28	28
Relocation and mitigation	33	15	23	13	15
Disaster relief programs	21	16	30	15	17
Flood plain wetland restoration	50	12	14	5	17
Agricultural support policies	20	7	28	17	28
Priority given to alternatives					
Limit flood fighting	67%	5%	12%	4%	8%
Remove agricultural levees	75	3	7	4	8
Agricultural levee setbacks	40	18	20	10	8
Uniform levee height	14	7	17	23	35
Raise agricultural levees	15	6	10	8	60
Raise urban levees	14	3	21	14	43
Protect critical facilities	3	1	9	22	59
Upland retention	3	2	10	25	57

Totals may not add to 100% due to rounding and no answers.

The priorities on the policy issues were fairly mixed. Only local flood plain management received a high rating with more than 50% of the respondents listing this policy as a 4 or 5. Only relocation and mitigation and Flood plain wetland restoration received low ratings.

The opinions on alternatives were more clear cut. This was primarily because the issues were more understandable and could be perceived as having a more direct effect on the respondents. Levee setbacks received the only low rating while all of the others received high ratings. Clearly, raising levees, protecting critical facilities and upland retention were the preferred alternatives.

About half of the attendees had attended previous public meetings for the FPMA. About 6% indicated that the information presented at the meeting resulted in them changing their previous opinion of the issues.

The results varied somewhat by meeting site.

Moline	Burlington	Quincy
	Low	High
	Low	High
High		High
	Low	Low
	Low	V Low
		High
	V low	V low
	Moline High High	High Low High Low Low

Remove agricultural levees		V low	V low
Agricultural levee setbacks		V low	Low
Uniform levee height		V high	High
Raise agricultural levees		V high	V high
Raise urban levees		High	V high
Protect critical facilities	High	V high	V high
Upland retention	V high	V high	V high

High or low indicates that more than 50% rated the issue above or below neutral, Very high or very low indicate that more than 50% rated the issue 5 or 1.

A correlation between the primary interest and the issue ranking also showed differences in opinions.

Agric.	Govt.	Home
	High V high	High V high
V high	High	High High
V low		J
	High	
V low		
V low		Low
Low		
		High
		High
_		
V high	High	V high
V high	High	V high
	V high V low V low V low Low High V high V high V high	High V high V high V low High V low V low Low High V high V high V high High

High or low indicates that more than 50% rated the issue above or below neutral, Very high or very low indicate that more than 50% rated the issue 5 or 1.

It must be cautioned that the numbers for those who indicated a primary interest other than agriculture are relatively small and the above results do not necessarily reflect the attitude of a larger population.

Subject: Public Meetings

The meetings are over and went well. Major comments related to the need to have limitations and uncertainties prominently described at the beginning of the report. Also findings need to be more specific when they do not apply to all reaches. Need to assure that findings are supported by data in the report. Draft has a lot of conjecture. Most other questions related to hydraulics. Attendance was about 55, 65, & 85 in Moline, Burlington, & Quincy. We received many comments on our presentation and willingness to listen.

Moline

I am glad to hear the recognition that allowing leveed areas to revert to natural condition is economically infeasible.

Serious consideration should be given to elevating levee height by the use of dredge material.

Upland storage by use of ponds, terraces, reservoirs, etc. should be funded and constructed.

The Mississippi River is a one of a kind in the world the most important issue is the quality of the waterway. This must be protected above all other issues.

It is not the governments fault that it floods. Suggest these people move to higher ground. Hey, RIVERS FLOOD! O.K.

Quincy

I would appreciate fairness in this study. Consider everything--don't be like the three (3) blind men touching and describing the elephant. At least, have someone who can see everything (entire picture). Seems the levee south of Cairo works, What is wrong with us having one like that?

You all had a tough job to do. We would defiantly like to see the levees raised support ag. there aren't many of us left.

Omaha District April Meeting Summary and Statistics

FPMA Questions/Issues MRO Public Meeting - Nebraska City, NE April 26, 1995

- 1. How much of the \$12-60 million dollars in damage was attributed to this region (southeastern Nebraska)?
- 2. Describe the 25-year notch. How big would the notch in the levee be and where would the water go? What is the effect of the notch; what are the conclusions?
- 3. What are the goals and objectives of the COE in floodplain management?
- 4. What about damage to infrastructure? Highway 2, Highway 36? What about raising them above flood level?
- 5. Why don't the Feds focus on pollution in the big cities on the east coast and the Great Lakes, for example, instead of picking on Nebraska farmers? Midwest is being unfairly picked on by environmentalists.
- 6. Does the Corps have any jurisdiction over the Platte River? Platte River is the cause of most of the floding in the reach from Omaha to Rulo.
- 7. Where is the COE taking this study? What is the purpose of this study with respect to findings? What was it trying to accomplish?
- 8. What is the FPMA report going to initialize?
- 9. Do you think that the endangered species act is being manipulated to control the operation of the reservoirs? Are upstream States using environmental concerns to manipulate the Corps operations.
- 10. Why isn't the focus of reservoir operation on flood control instead of T&E or is it?
- 11. What is the purpose of this meeting? Are our comments going to affect the outcome of the Master Manual?
- 12. Who made the decision on the Master Manual? Who will make the final decision on which alternative is chosen for the Master Manual?
- 13. Where is the Master Manual plan going? Will there be condemnation of land?
- 14. What about aggradation in front of the levees?

- 15. Is water quality an issue for the T&E birds and fish?
- 16. National flood insurance? Disaster programs? Earthquake insurance? Why should only the people in the floodplain be penalized?
- 17. What was the '93 flood rated for frequency of event?
- 18. What was the maximum flow at Omaha?
- 19. Where were the aggradation measurements between the levee and the river taken? Were the differences noted for proximity to cropland vs. timber?
- 20. What would happen if someone took it upon himself to raise the Federal levee?
- 21. How are damages calculated? Is there any way to estimate the potential income loss from lost business days due to flooding? Are there damages and benefits that aren't included in the calculation in typical Corps projects?
- 22. How would power generation (other than hydropower) be affected without the levees or with notched levees? What was hydropower generation's role in the '93 flood?
- 23. How much at risk was Cooper Nuclear Plant in '93?
- 24. There is a great deal of sedimentation between the levees and the river. What do we do about reduced capacity?
- 25. What height would have saved the levee by Brownville?
- 26. Gaging stations are at bridges where flow is constricted; does that affect the readings?
- 27. The Corps misdesigned the levees below the Nishnabotna River. The levees should have been higher. The flow of the river was greatly underestimated.
- 28. What will come out of this meeting/report?
- 29. What is the comment period?
- 30. How many more studies will be done on the '93 flood?
- 31. How do we obtain copies of the report?
- 32. Why isn't there a court reporter present? How much weight has been given our comments? Are you (COE) getting a true picture of what the people really want for the rivers? Will you really do

anything with our comments?

- 33. Why haven't local people been consulted before the outcome of these studies?
- 34. Why do people in Omaha and Lincoln dictate what will be done with the river? Why isn't it up to the people on the river?
- 35. What are the effects of urban runoff on the river stages?
- 36. Why are the stages so high now and for the past two weeks? What will the immediate future bring?
- 37. What are the effects of the tributaries on the level of protection?
- 38. Has the Corps changed its goals in the last 20 years away from flood control?
- 39. Need to mark off the '93 flood as done and get on with finding an acceptable compromise with environmental constraints.
- 40. Have all the costs been counted (e.g. infrastructure) in the levee removal alternative

WRITTEN:

- 2: Excellent information in a well conducted meeting.
- 2: The Pick-Sloan plan originally called for a 3,000 foot floodway from Sioux City to Kansas City. Present floodway averages 700 feet. Plan called for a 5,000 foot floodway from KC to St. Louis. Present floodway averages 1,200 feet. How would these floodways affected the 1993 flood at the width of the original plan?
- 5: Small percentage conversion of agricultural land can result in large percentage increase in natural floodplain acres.
- 8: We need to cooperate.
- 16: Comment questions are very deceptive.
- 16: Why are rural residents being victimized by our own government agencies?
- 16: I favor programs that will benefit people--not fish, birds or beauracrats!
- 18: I am in favor of less disaster programs and more insurance if is done fairly across the USA. IE: Include hurricane and earthquake areas as well as floodplain.

- 19: There should be uniform insurance for disasters throughout the U.S.--for hurricanes and earthquakes as well.
- 19: Need to raise levees to restore earlier levels of protection before siltation made protection levels decline.
- 20: Quit buying land along the river and creating areas to retain silt and sand., it is decreasing the capacity of the missouri flood basin, at the same time costing lots of tax dollars.
- 26: The Missouri River Mainstem System is a tremendous system, built at great expense by the citizens of the United States. Its contribution to our country is considerable. Let us not tear it down to satisfy selfish interests but maintain it at a high level.
- 26: Your information was interesting and well presented.
- 27: Priority questions do not relate to presentation. Not helpful. Evaluation of the numbers would mean much.
- 34: Perhaps best compromise is "string of beads."

15. 3 - Split or stack dividend of the past 52 weeks. The high-low the old stock, Dividend begins tock dividend, st - Stamped, t -ing 12 months, estimated cash x-distribution date, in - Units_v - Trading halted on bankruptcy or receivership of the Bankruptcy of the state of

the Bankruptcy Act, or securi-

ine bank which can be also nies.

Victoria Vaughan, who oversees the centers, said 11 of those 20 schools are scheduled to have an intervention room next year.

The board members also talked about making schools safer.

Five more security aides could be

schools. Students are assigned there for various reasons, including disruptive behavior, emotional or physical problems and suspension for drug and alcohol violations. The school day is shorter than at a regular school, and the curriculum is

Corps Says Flood-Control Plans Must Consider Multistate Impact

BY KENDRICK BLACKWOOD WORLD-HERALD STAFF WRITER

Nebraska City, Neb. — Flood control along the Missouri River must be considered from a systemwide perspective, says a preliminary report by the Omaha District of the Army Corps of Engineers.

. If levees had been higher during the 1993 flood to protect key locations, some areas farther downriver would have suf-

fered, the report said.

More than 50 people gathered to discuss the report Wednesday night at the Lied Conference Center in Nebraska City. Known as the Floodplain Management Assessment of the Upper Mississippi and Lower Missouri Rivers, the report was requested by Congress and is to be completed in June.

"The one thing we learned from all this ... was how important a systemic evaluation is," said David Brandon, who coordinated the report. "You really have to look at the whole river."

The information in the report came from a computer program called UNET, which simulated the results of the 1993 flood based on certain variables over an eight-state region.

Variables included:

- What if there had been no levees at all?
- What if the levees were set at a uniform 25-year flood level?
- What if there were no reservoir dams in the northern portion of the Missouri River?

- What if area farmers at higher elevations had taken steps to reduce
- What if the levees were raised high enough to have contained the 1993

The report was not created as a step toward taking specific action, but rather as a reference for future plans, Brandon said.

"Hopefully this will be some good, solid foundation to do further evaluation," Brandon said. "We're not projectoriented at this point. It's best seen as a study."

The report disputed the assumption that more wetlands in the higher elevations would have made a difference along the river because more water would have been held back, Brandon said. The amount of rain preceding the flood had left the wetlands saturated to the point that they could not help by holding more water, he said.

The model did attest to the importance of dams along the north edge of Nebraska. Brandon said.

Without the reservoirs, the high-water mark would have been even higher almost all along the river, the report said.

"The reservoirs did a lot of good, no doubt about it," Brandon said.

The landowners in the audience were concerned about the idea of establishing a uniform 25-year levee level along the river. But corps officials said that such a change wouldn't have done a better overall job of controlling the 1993 flood.

St. Louis District April Meetings Summary and Statistics

CELMS-PD-F 28 April 1995

SUBJECT: FPMA Public Meeting, East Alton, 18 Apr 95

- 1. The following information is the informal meeting notes taken by CELMS-PD-F, Mr. Dave Leake.
- 2. Peak Attendance: 30
- Q: May 5th confirmed as cutoff for comments.
- Q: Bensman asked basis for our conclusion that wetlands had no impact.
- A: Computer modeling; 5 & 10% flow reduction scenarios; also coordinated with authors of ISWS Report.
- Q(Jim Powell): Who defines the Base Flood Elev?
- A: FEMA with help of Corps (or A/E's).
- Q: How can we comment on expanding boundary of 100-year flood when we don't know where that boundary is?
- (Powell comment): FEMA looks at Cabins riverside of levee as being at same risk as those landside of levee.
- A(Perulfi): Explains pre-FIRM and past-FIRM and eventual progression toward an actuarily based system. Explains pre-FIRM damaged 3 times more often than post-FIRM structures.
- Q(Robb): Is the Corps advocating that no one be allowed to raise his house on fill? We want a report to state that in sparsely populated areas, it's acceptable to build on fill.

We're spending \$54m in Vallmeyer area when Corps' own report says we could have raised levee for \$8-9m and prevented all damage. <u>PUT THESE FACTS IN REPORT.</u>

- Q: If East St. Louis Levee District did the work, then levee could be certified.
- A: Not knowledgeable on this issue.
- C: Oil CO's should monitor their pipelines.
- C(Robb): EMP has not been effective because these rivers are in a state of crisis. Why can't you display in dollars what the EMP has produced for its millions?

C: If damages in Age areas are relatively insignificant, why is everyone "pointing a gun" at us.

C(Robb): Media doesn't see enough of report.

Bensman: FWS should administer the EMP.

Robb: Chapter 8, page 28, Subsidy Programs: Need to compare payouts for floods to leveed areas and payouts to upland areas for droughts.

Robb: \$1.8 billion would raise levee 6-8' (5:1 backslopes) using dredged material. We think Corps costs are way too high.

C(Robb): Page 40, Dennis S. indicates report is currently being revised.

Powell: You should be showing a benefit to large traffic for levees on the lower Illinois. This is also probably true of other river reaches. This needs to be noted in the report.

A(John P.): Quotes Simons and Li saying middle Miss is more stable than lower Miss.

Dave R: On the MO river, levees are very important.

C: People should not be allowed to build so close lakeside.

Does report cover filling in wetlands?

Considerable discussion regarding effects of 25-year agr levee action alt and the effects of timing.

Robb: Comments on page 37.

C: Question wisdom of using '93 Flood $\underline{\text{only}}$ as a basis for policy development.

Powell: "Floodplain Assessment" is a misnomer, it should be a basin assessment.

Powell: He feels that he shouldn't be required to have flood insurance.

- C: Disagrees that people in floodplain should pay for entire problem.
- 3. Considerable discussion and exchange of views occurred with the meeting lasting 7 p.m. to 9 p.m., with about a half hour additional discussion.

CELMS-PD-F 28 April 1995

SUBJECT: FPMA Public Meeting Waterloo, IL, 19 April 1995

- 1. The following information is the informal meeting notes taken by CELMS-PD-F, Mr. Dave Leake.
- 2. Peak Attendance: 81
- Q: Do changes in FIP apply to Agr buildings also?
- C: Person should have right to build anything he wants on his own land if he signs a waiver saying he will not seek or accept money from Federal Government.
- Q: Why don't you address effects of urban sprawl? You reward urban areas with high levels.
- Q: Why didn't you look at a plan that dredged river and also removed rock (dikes)?
- A: We formulated plans around changes to flood control features, not nav. features. Anyway, in '93 there was so much water, dike removal and dredging would have made little difference.
- Q: What was major difference in '73 flood and '93 flood?
- A: Amount of rain.
- Q: What makes the river fluctuate so much more today?
- A: Speculate that it's speed of runoff.
- C: Developers should have to pay tax to help pay for our flood insurance.
- Q: How much money was spent by Government in '93 and how much of that was spent in f.p. itself? I've heard about 5 51/2 billion in f.p. yet, it only costs 5.7 billion to raise levees from Cairo to St. Louis. Is this solution too simple? Also, why not use dredged material to build up levees?
- A: See columns in the matrix table provided.
- Q: Did anyone calculate what it would cost to relocate everyone vs cost of raising all levees?
- A: Yes, see rows 24 and 25 in matrix table provided.

- Q: Is your buyout different from FEMA's buyout where they only bought out your house leaving sheds, etc there?
- A: yes, we have costed buying out entire farm.Q: Is Agr not one of most important factors in equation?
- A: Yes.
- Q: Was one of your conclusions that Agr. is a logical use of floodplain?
- A: Yes
- Q: Why can't Agr. be given special consideration?
- C: I don't feel bad because my Government spent tens of billions protecting me in the floodplain. Look at amount spent in foreign aid.
- C: The regulations applied to urban areas shouldn't be applied in sam way to Agr. areas.
- Q: What is risk of flooding in Lower Mississippi compared to Upper Mississippi.
- A: Much less in Lower Mississippi River.
- Q: Is it possible to design and build a similar system for upper river?
- C: It's immoral for FEMA to blackmail local Governments into zoning Agr. out of bottomland.
- Q: What's happening with Missouri River Master manual?
- A: It's going to court.
- Q: Who does forecasting for river?
- A: NWS, Forecasts are getting poorer.
- Q: Are you looking at waste in Federal programs? Roughly 25% of dollars expended in disaster relief in Monroe County was wasted or subject to fraud.

- C: Urbanites and Environmentalists today have so much influence over politicians, we have no hope of controlling our own destiny.
- Q: Have you looked at a policy to remove trees from overflow areas riverword of existing levees?
- A: No, we'll try to look at it.
- Q: It is Corps policy and their control of wetlands that prevents clearing of trees atreservoir projects.
- C: They don't make people move out when a tornado or hurricane devastates an area, why do they do this with flood victims?
- 3. Considerable discussion occurred, with the meeting lasting from 7 p.m. until 11 p.m., with additional discussion beyond closing.

CELMS-PD-F 28 April 1995

SUBJECT: FPMA Public Meeting St. Peters, MO, 20 Apr 95

1. The following information is the informal meeting notes taken by CELMS-PD-F, Mr. Dave Leake.

- 2. Peak attendance: 70
- C: Can only assess significance of scenario to remove all levees if we know how many of these levees were overtopped in "93.
- Q: Why did early major floods such as 1844 have as much or more flow but lower stages?
- A: Different more accurate gaging capabilities; No urban levees in 1844.
- Q: How many acre/feet of water is represented by 10% flow reduction? How much storage (in acre/feet) is included in floodplain?
- C: A <u>physical</u> model shows 1844 flows were much lower, 800,000 cfs, per CELMS-PD-HE paper.
- Q: Will we ever have this bad a problem again?
- A: Yes, probably worse at some point.
- C: Proposes a new scenario: higher levees to pass higher early flows, then reservoir storage could be reserved for flood peaks.
- C: In Agr levee removal, you didn't look at Hwy or RR embankments in.
- Q: Did you estimate cost of Agr levee removal and cost of buying land.
- A: Yes, see matrix table provided.
- Q: Why don't we have diversionary channels such as they have in New Orleans.
- A: In New Orleans, we have relatively new channels and several of them. Therefore, they have natural diversion channels which we can't carve out of limestone bluffs in this reach of the river.
- C(Robb): There is simply not enough storage behind the various levees to make any significant difference in St. Louis.

- C: In urban environment, overtopping levees causes loss of life; in Agr areas it causes loss of a year's income.
- Q: What will happen in the Howard Bend area if a 500-year levee is constructed in Chesterfield.
- Q: Would Monarch Levee have overtopped were it not breached?
- A: Uncertain.
- Q: What are you finding in regard to levee setbacks? Does it make sense to set back levees when bridges continue to be the major restriction?
- Q: Is there reservoir storage.
- C: No one is suggesting that all AGR levees be removed.
- Q: Did you model the impact of the Truman Reservoir?
- A: Yes, the Truman Reservoir prevented a flood of similar stage at Chesterfield in 1994.
- Q: Didn't see effects of navigation and transportation reflected in report.
- A: True, navigation effects weren't included because it would have been a similar loss regardless of the scenario.
- Q: Are you going to use the UNET model to make future real time forecasts?
- A: Not sure.
- Q: Can you address the view that everything would be ok if river is reconnected with its floodplain? We feel that the statement currently in the report is misleading and incorrect and should be removed.
- C: It's not only the farmers who use chemicals.
- Q: Could model be used to look at removing <u>all</u> the effects of manking?
- A: Yes and we're considering doing that.
- C: I'm concerned that your study is not going to make recommendations. Politicians need this guidance. If you're the best organization to make the study; you're probably the best organization to make recommendations.

- Q: Are you going to look at effect of width of channel? Say a 3000' bridge opening vs a 4000' opening.
- 3. Considerable exchange of views and information occurred including the Missouri River Master Manual Review. The meeting lasted from 7 p.m. to 9 p.m. with about an additional hour discussion after the formal close of the meeting.

Kansas City District April Meetings Summary and Statistics

CEMRK-EP-PF

25 April 1995

MEMORANDUM FOR RECORD

SUBJECT: Summary of final Public Workshops in Kansas City, Missouri, and Saint Peters, Missouri, for the Floodplain Management Assessment (FPMA).

- 1. In April of 1995 the Kansas City District conducted 2 workshops to present the findings and conclusions of the FPMA to the public. The workshops were formatted in a manner in which a 30 minute slide show/presentation was given to present the basic findings and conclusions of the FPMA study. Following the presentation the public was given the opportunity to ask any questions and give any comments about the subject study.
- 2. The Kansas City, Missouri, workshop was conducted on Tuesday, 18 April 95, at the Adams Mark Hotel. Approximately 33 persons attended the workshop and 24 individuals returned comment sheets. The majority of the workshop participants represented the agricultural interests. The workshop lasted from 7:00 p.m. to 9:30 p.m.. Those present from the Corps included:

Chris Erickson, KCD, POC,
Jeanne Musgrave, KCD, Economics,
Mike Wolfender, KCD, Public Involvement,
Robert Ruf, KCD, Environmental,
Robert Pearce, KCD, Hydrology and Hydraulics,
Rebecca Allision, KCD, Hydrology and Hydraulics,
George Hanley, KCD, Public Affairs, and
Roy McAllister, MRD, Missouri River Master Manual.

3. The Jefferson City, Missouri, workshop was conducted on Wednesday, 18 April 95, at the Capital Plaza Hotel. Approximately 75 persons attended the workshop and 52 individuals returned comment sheets. The majority of the workshop participants represented the agricultural interests. The workshop lasted from 7:00 p.m. to 10:00 p.m.. Those present from the Corps included:

Chris Erickson, KCD, POC,
Jeanne Musgrave, KCD, Economics,
Mike Wolfender, KCD, Public Involvement,
Robert Pearce, KCD, Hydrology and Hydraulics,
Larry Crump, KCD, Public Affairs, and
Roy McAllister, MRD, Missouri River Master Manual.

- 4. Listed below are comments/statements/observations that were received in the workshops. The comments are not listed in any particular order.
 - a. Participants felt the time to review and comment on the draft report was inadequate.

- b. Some participants felt they have not been properly informed of the FPMA study and public meetings.
- c. There is concern that the "policy makers" will make specific policy and proposals from this report when it only looks at the extreme 1993 Flood Event.

COE-KC-PLANNING

- d. There is some confusion concerning the various activities on the Missouri River. They expected more definite linkage among the FPMA, Missouri River Master Manual, and the Missouri River Mitigation project. Feedback of the public is confusion and anger over the Government spending considerable amount of taxpayer dollars.
- e. The public would like to know the specific disposition of the final report. "What is going to happen to this report once completed?"
- f. Comments were received as to the accuracy of the UNET model and the perception that this model is so exact. Concern was expressed that a comprehensive physical model needs to be developed for the Missouri and Mississippi River systems.

 NOTE: In the report we need to make sure that we discuss that the UNET is a Model, remember a model is an abstraction from reality, it does not represent reality exactly, IT IS ONLY A MODEL.
- g. Concern was expressed that the systemic levee set-back alternative will not include an evaluation of the economic, environmental, and risks impacts.
- h. The Osage River Group was disappointed that the FPMA did not look at major tributaries, specifically at the Osage River Basin and all associated COE projects.
- i. Some organizations and interests stated they would submit formal comments about the study and draft report to Dave Loss, NCS.

In addition, some comments expressed frustration about the current Missouri River Master Manual preferred alternative. These comments were addressed by Mr. Roy McAllister, MRD. Other comments received at the meeting addressed site specific issues beyond the scope of the FPMA.

Chris Erickson, FPMA, POC

Flood Risk Reduction Program

Association of State Floodplain Managers, Inc.

P.O. Box Madison.

Wisconsin 53701-2051

608-266-1926

Background - Established in Wisconsin in the mid 1980's. States are the primary members with Federal and others as associate members.

Purpose - To coordinate and reinforce a variety of interests, such as flood damage reduction, environmental protection and restoration, economic development, recreation, agriculture, and fisheries.

Programs or Activities - Rivers, Trails and Conservation Assistance Program through multi-objective workshops.

Board of Water and Soil Resources (Minnesota)

155 So. Wabasha Street, Suite 104

St. Paul, Minnesota 55107

Background - Formed in 1987 to work with Soil and Water Conservation districts, Watershed districts and counties throughout Minnesota. This board provides financial and technical assistance to their programs; and administer statewide comprehensive local water planning statute.

Department of Agriculture (Illinois)

State Fair Grounds P.O. Box 19281 Springfield, Illinois 62794-9281

217-782-9272

Background -

Purpose - To protect and promote the State's agricultural and natural resources. The agency provides services that benefit consumers, farmers, and agri-businesses.

Programs or Activities - Publications: Illinois Agricultural Guide

Department of Agriculture (Minnesota)

90 West Plato Boulevard

St. Paul, Minnesota 55107

612-297-2200

Background - Established 1919.

Purpose - Enforces laws to protect the public health, promote family farming and marketing of farm products. Conservation of soil and Water.

Programs or Activities -

Department of Agriculture (Missouri)

Programs or Activities - Publication: Missouri Conservationist

Department of Energy and Natural Resources (Illinois)

325 West Adams Street, Room 300

Springfield, Illinois 62704-1892

217-785-2800

Background - This nonregulatory agency was founded in 1978 to conduct applied environmental/economic research to guide government and private-sector energy/natural resource policy decision.

Purpose - The nine divisions provide scientific inquiry and public education to protect, preserve, and develop Illinois natural and cultural resources.

Programs or Activities - Publications: Illinois Resources; Recycling Update; The Living Museum; The Illinois Natural History Survey Reports

Department of Environmental Control (Nebraska)

301 Centennial mall South

Lincoln, Nebraska 68509

402-471-2341

Background - Created by the Nebraska Environmental Protection Act in 1971

Purpose - Administers and enforces rules and regulations, and monitors the quality of the environment in Nebraska.

Programs or Activities - Publication: Environmental Update

Department of Natural Resources (Iowa)

Wallace Building

East Ninth and Grand Avenue

Des Moines, Iowa 50319-0034

515-281-5145

Background - Established July 1, 1986. The Natural Resources Commission is a policy and rule setting authority over the Fish and Wildlife Division, Parks, Recreation, and Preserves Division, and the Forestry Division. The Environmental Protection Commission is the policy- and rule-setting authority over the Environmental Protection Division.

Purpose -

Programs or Activities -

Department of Natural Resources (Minnesota)

500 Lafayette Road

St. Paul, Minnesota 55155-4001

612-296-6157

Background - Created in 1931 as a stewardship of Minnesota's resources, but called The Department of Conservation until 1971.

Purpose - Goal to achieve optimum natural resources planning, protection, and development responsive to public need, consistent with resource potentials, and for the social and economic well-being of both present and future generations.

Department of Natural Resources (Missouri)

P.O. Box 176

Jefferson City, Missouri 65102

314-751-3443 (1-800-334-6946)

Background -

Purpose -

Programs or Activities -

Department of Natural Resources (Wisconsin)

Box 7921

Madison, Wisconsin 53707

608-266-2621

Background -

Purpose - Long-range planning in the broad fields of outdoor recreation and natural resources. Also responsible for endangered resources protection, air and water pollution control, and enforcement of conservation and environmental laws, floodplain and shoreland zoning.

Programs or Activities -

Department of Water Resources (Nebraska)

State House Station

Box 94676

Lincoln, Nebraska 68509

402-471-2363

Background - State Agency

Purpose - Administers and enforces the State water laws and all matters pertaining to water rights.

Programs or Activities - Measuring and recording the flow of various streams and canals; approving plans and specifications for dam construction, inspection of dams, approving plans and specifications for construction activities in floodplains plains, and registration of wells. Publications: Channels Newsletter, Biennial Report, Hydrographic Report.

Division of Water Resources (Illinois)

3215 Executive Park Drive P.O. Box 194484 Springfield, Illinois 62794 217-782-3397 Background -Purpose -Programs or Activities -

Game and Parks Commission (Nebraska)

2200 No. 33rd Street P.O. Box 30370 Lincoln, Nebraska 68503 402-471-0641

Background - State commission

Purpose - Sole charge of State parks, game and fish, and all things pertaining thereto; boating, and administration of the Land and Water conservation Fund.

Programs or Activities - Publications: Nebraska Land Magazine

Geological and Natural History Survey

University of Wisconsin, Extension 3817 Mineral Point Road Madison, Wisconsin 53705 608-262-1705

Background - Created by the legislature in 1897.

Purpose - Responsibility to survey the State's geology, mineral, water, soil, plant, animal, and climate resources, and to coordinate topographic mapping.

Programs or Activities -

Geological Survey

University of Minnesota 2642 University Avenue St. Paul, Minnesota 55114 612-627-4780

Background - Established in 1872 as a Geological and Natural History Survey, reconstituted in 1911 under its current nomenclature.

Purpose - Investigate the geology of the State; describe, classify, and map the geological formations and mineral and water resources; and investigate all aspects of the geology affecting the environment.

Programs and Activities - (Publications - not listed)

Illinois Environmental Protection Agency

2200 Churchill Road Springfield, Illinois 62794 217-782-3397

Background - Founded in 1970 to administer a variety of programs to protect the air, land, and water.

Purpose - Responsible for implementing the environmental program for the State of Illinois.

Programs or Activities - Publications: Digester/Over the Spillway; Environmental Progress

Illinois Natural History Survey Division

172 Natural Resources Building 607 East Peabody Drive Champaign, Illinois 61820 217-333-6880

Background - Founded in 1858 to protect and provide informed use of the State's renewable natural resources. Purpose - Conducts research to assure the maintenance of biodiversity and sustained economic, educational, and recreational benefits.

Programs or Activities - Publications: Bulletin; Circular; Biological Notes; INHS Reports

Illinois State Geological Survey (ISGS)

Natural Resources Building 615 East Peabody Drive Champaign, Illinois 61820 217-333-4747

Background - Founded in 1905. A scientific and professional staff of 200 engaged in research and service on the application of geology, geochemistry, and minerals engineering.

Purpose - To protect the environment and develop the mineral resources of Illinois. Division of the Illinois Department of Energy and Natural Resources and allied agency of the University of Illinois.

Programs or Activities - Reference Library; Publications: Environmental Geology, Illinois Minerals

Iowa Association of County Conservation Boards

117 Main Street Elkhart, Iowa 50073 515-367-4000 Background -

Purpose - Promotes the objectives of Iowa's County Conservation Boards, board member education, information exchange, legislation and public awareness.

Programs or Activities - Publications: Iowa Board Member; IACCB Memo; IACCB Legislative Update

Kansas Biological Survey

University of Kansas Foley Hall 2041 Constant Avenue Lawrence, Kansas 66047-2906 913-864-7725

Background - Founded in 1959. A research and development branch or the University of Kansas. Purpose - To survey and inventory the native plants and animals of Kansas, report on its findings, and develop and administer lands for the study and preservation of native animal and plant resources. Programs or Activities -

Kansas Department of Wildlife and Parks

900 Jackson Street, Suite 502 Topeka, Kansas 66612-1220 913-296-2281 Background -

Purpose - Charged with the conservation of State wildlife and fishery resources, provision of environmental services and habitat protection, and park development and management. Administers State boating law, hunter education programs, Land and Water Conservation Funds, and other related functions. Programs or Activities - Publication: Kansas Wildlife and Parks

Kansas Geological Survey

Kansas University Campus West 1930 Constant Avenue Lawrence, Kansas 66047 913-864-3965

Background - Founded 1989

Purpose - To research and develop information about minerals, water resources, and geologic hazards of Kansas, and to publish reports on those subjects.

Programs or Activities - Publications: Bulletin; Journals; Maps; Energy Series; Mineral Resources Series; Environmental Geology Series; Subsurface Geology Series; series on Spatial Analysis; Chemical Quality Series; and Ground Water Series.

Land and Water Resources Bureau (Wisconsin)

Department of Agriculture Trade and Consumer Protection 801 West Badger Road Madison, Wisconsin 53713 608-267-9788

Background -

Purpose - Responsible for administering State Soil and water conservation and farmland preservation programs. Programs or Activities -

Minnesota Pollution Control Agency MPCA

520 Lafayette Road

St. Paul, Minnesota 55155

612-296-6300

Background - Established 1967. Administers the State statues covering water pollution, air pollution, and solid and hazardous waste control.

Background - Organized 1951. Works through legislation, education, and the courts. Initiated and sponsored the action which resulted in the banning of DDT in Wisconsin and two years later in the United States.

Purpose - To protect Wisconsin's natural resources.

Programs or Activities - Protecting and restoring native vegetation along Wisconsin's roads.

Coalition to Restore Urban Waters

*

Central Regional Contacts Minority Environmental Association 3509 Milar Road Sandusky, Ohio 44810 419-625-3230

Background - Political Action Committee

Purpose - The promotion of multi-objective floodplain management in which the solutions selected for reducing damages in flood prone communities address the needs for urban quality of life, open space, recreation, environmental education, protection of biodiversity, and restoration of downtown business, cultural institutions and economic interests. The revival of labor intensive environmental restoration technologies and programs and development of new restoration and watershed management methods which restore the natural functions of streams and associated wetlands. The advancement of river restoration methods, promotion of rivers as "greenways," and expansion of the focus of national and State clean water regulatory programs.

Programs or Activities -

Coastal America

Background - Recognizing the need to protect, preserve, and restore our living coastal heritage, the President announced the Coastal America initiative in February 1991. This initiative established a partnership for action among the four Federal agencies having primary responsibility for the management, regulation, and stewardship of coastal living resources: the Department of the Army, the Department of the Interior, the Environmental Protection Agency, and the National Oceanic and Atmospheric Administration. The President's Council on Environmental Quality coordinates the partnership. The partners are committed to a national effort which initially contaminated sediments. The initiative focuses on regional activities that provide direct local and watershed action as well as national projects. Membership in the partnership is open to those agencies with statutory responsibilities for coastal resources or whose operational activities affect the coastal environment.

Purpose - To protect, preserve, and restore the Nation's coastal ecosystems through existing Federal capabilities and authorities: to facilitate collaboration and cooperation in the stewardship of coastal living resources by working in partnership with other Federal programs and integrating Federal actions with State, local, and non-governmental efforts; and to provide a framework for action that effectively focuses agency expertise and resources on jointly identified problems to produce demonstrable environmental and programmatic results that may serve as models for effective management of coastal living resources. Programs or Activities - Coastal America provides a forum for interagency consultation to identify possibilities for collaborative action and facilitate regional action plans to protect, preserve, and restore the Nation's coastal living resources. (A Principals Group, a National Implementation Team (MIT), seven Regional Implementation Teams (RITs), and a Coastal America office at the President's Council on Environmental Quality).

Minnesota-Wisconsin Boundary Area Commission

* 10 commissioners

619 2nd Street

Hudson, Wisconsin

612-436-7131

Background - Established September 1965 by interstate compact between Minnesota and Wisconsin. Each Governor appoints five citizen commissioners.

Purpose - To assist the two States in cooperative efforts on their "boundary lands, river valleys, and waters." (primarily Mississippi and St. Croix Rivers) Viewed as a liaison between the public and the State and local government agencies. Extensive public education and information program.

Programs or Activities - Conducts studies and makes recommendations on plans, policies, development proposals, public management, uniform laws, and conservation efforts. Current issues of interest include recreational use and development, water quality, blufflands protection, water surface use law enforcement, Stillwater-Houlton bridge, river stewardship, and watershed system issues. Has actively promoted the EMP. FY 1995 budget of \$370,000 supported in part by appropriations of \$130,000 per State. Four full-time staff in Hudson, Wisconsin.

Mississippi River Basin Alliance

Box 3878

St. Louis, Missouri 63122

314-822-4114 (FAX: 314-821-4292)

Background - Incorporated in May 1994; sixty organizations throughout the midwest.[501(c)(3); with by laws]

Purpose - The Alliance's purpose is to "protect and restore the ecological, economic, cultural, historic and recreational resources in the basin; and to eliminate barriers of race, class and economic status that divide us in the quest to achieve these purposes."

Programs or Activities - Sponsors pesticide workshops in conjunction with the National Campaign for Pesticide Policy Reform. Working to implement recommendations from the Galloway Report, securing meaningful Federal wetland parcels, and determining its role concerning the Army Corps of Engineers navigation expansion study. Publication: Newsletter (One People One System)

Mississippi River Coordinating Commission

* 22 member

National Park Service

Mississippi National River and Recreation Area

P.O. Box 65456

St. Paul 55165

612-290-4160

Background - Coordinating Commission authorized by Congress is comprised of 22 members including citizens, local officials, State agencies, and federal agencies.

Purpose - Deals with the Twin Cities, Minnesota portion of the river designated as the Mississippi National River and Recreation Area by Congress in November 1988.

Programs or Activities - Commission serves as an advisor for the area and will assist the national Park Service in implementing an integrated resource management plan for this new unit of the national park system. The management plan is currently awaiting approval by the Secretary of the Interior.

Mississippi River Corridor Study Commission (Heritage Corridor Commission)

Evan Zantow, Wisconsin Commissioner 355 West Franklin St. West Salem, Wisconsin 54669 608-786-0744

Background - The commission has involved the general public throughout their process through news letters, press bulletins, newspaper articles, commissioner speaking engagements, and commission meetings. Purpose - To provide a means and a stimulus to organize, coordinate, and assist individuals, organizations, communities, businesses and governments to identify and reach common goals and visions. To stimulate the full potential of economic development compatible with the environmental health of the corridor. To preserve, restore, and enhance environmental, cultural, agricultural, historic, recreation, and economic resources within the corridor. To improve access to and within the corridor for the use and enjoyment of its resources.

Programs or Activities - The MRCSC is working with numerous entities that reflect the interests of the river valley and that have a great deal of influence on significant aspects of the Mississippi River. Compiling summaries of significant Mississippi River resources within their jurisdictions. Reviewing and

amending heritage corridor issues and functions. Assessing the feasibility of heritage corridor management alternatives and defining their role in potential heritage corridor structures.

Mississippi River Parkway Commission (MRPC)

* 10 members 336 No. Robert Street St. Paul, Minnesota 612-224-9903

Background - Established in 1938 by the Governors of the 10 States which border the river. Each State has its own Commission. All 10 are consolidated to form the national MRPC. Commission member are established by State statute or appointed by the governor. Generally, they are State legislators, county board members, citizens, or State transportation or tourism agency officials.

Purpose - To coordinate the technical development and promotion of the Great River Road. The commission has expanded its areas of interest to include tourism promotion, recreation, and economic development.

Programs or Activities - The Commission conceived and promoted establishment of the Heritage Corridor Study and Commission. The Great River Road Association is a companion grass roots organization comprised of individuals and businesses with an interest in Great river Road and enhancement of the river's scenic, historic, and recreational resources.

The Nature Conservancy

* 18,000 Minnesota members Minnesota Chapter - Box 110 1313 5th Street S.E. Minneapolis, Minnesota 55414-1588 612-331-0700 or 19110 Ramsey Road Deephaven, Minnesota 55319

Background - International membership organization committed to the preservation of natural diversity. The agency was incorporated in 1951 in the District of Columbia for scientific and educational purposes and is a non-profit, tax-exempt corporation. The Minnesota Chapter was formed in 1958. The Conservancy owns more that 1,300 preserves, a system of nature sancturaries. The Minnesota Chapter retains ownership of 59 preserves totaling 18,780 acres and has been involved in the protection of more than 200,000 acres throughout the States.

Purpose - Its mission is to find, protect and maintain the best examples of communities, ecosystems, and endangered species in the natural world. Specifically, the protection of rare plants nad animals and the natural communities that support them.

Programs or Activities - Responsible for the protection of 7.5 million acres in 50 States and Canada. Assisted partnership organizations to preserve millions of acres in Latin America and the Caribbean. The Minnesota Chapter owns and manages about 18,00 acres of land in 52 preserves.

Navigation Study Governors Liaison Committee

Background - Representatives designated by the Governors of the five States. Meeting in conjunction with meetings of the Upper Mississippi River Basin Association, the members of which are largely the same. Purpose - To provide input to the Corps of Engineers on the on-going Upper Mississippi River-Illinois Waterway System Navigation Study.

River Resources Forum

Harold E. Taggatz, Co-Chairman U.S. Army Corps of Engineers St. Paul District 190 E. Fifth Street St. Paul, Minnesota 55101-1638

612-290-5311

Background - Formed as an interagency coordination group to continue the cooperative relationship established during the GREAT I study, October 1986, and to facilitate the implementation of the study recommendations. Formerly called the Channel Maintenance Forum. Participants include 6 Federal agencies, 3 Minnesota agencies, and 2 Wisconsin agencies.

Purpose - General area of interest is the Mississippi River in the Corps of Engineers' St. Paul District. This agency provides an opportunity for the member agencies to generally discuss and resolve a variety of interagency issues, the primary focus is the Corps' channel maintenance program and prioritizing EMP habitat projects in the St. Paul District.

Programs or Activities - Most recently the RRF has undertaken development of a comprehensive recreation management plan. Subgroups include: on-site inspection team, fish and wildlife work group, recreation work group, navigation work group, and public information and education work group.

River Resources Coordinating Team

IIC A.....

U.S. Army Corps of Engineers

Rock Island District

Rock Island, Illinois

Background - Counterpart of the River resources Forum in the Rock Island District, U.S. Army Corps of Engineers. Participants include 6 Federal agencies, 2 Illinois agencies, 2 Iowa agencies, 1 Missouri agency, and 2 Wisconsin agencies.

Purpose - Similar issues and functions of their counterpart, River Resources Forum.
